ANNEX I

SUMMARY OF PRODUCT CHARACTERISTICS
This medicinal product is subject to additional monitoring. This will allow quick identification of new safety information. Healthcare professionals are asked to report any suspected adverse reactions. See section 4.8 for how to report adverse reactions.

1. NAME OF THE MEDICINAL PRODUCT

Hulio 40 mg/0.8 ml solution for injection

2. QUALITATIVE AND QUANTITATIVE COMPOSITION

Each 0.8 ml single dose vial contains 40 mg of adalimumab.

Adalimumab is a recombinant human monoclonal antibody produced in Chinese Hamster Ovary cells.

Excipient(s) with known effect
Each vial contains 38.2 mg sorbitol (E420).

For the full list of excipients, see section 6.1.

3. PHARMACEUTICAL FORM

Solution for injection (injection).

Clear or slightly opalescent, colourless to pale brownish-yellow solution.

4. CLINICAL PARTICULARS

4.1 Therapeutic indications

Juvenile idiopathic arthritis

Polyarticular juvenile idiopathic arthritis

Hulio in combination with methotrexate is indicated for the treatment of active polyarticular juvenile idiopathic arthritis, in patients from the age of 2 years who have had an inadequate response to one or more disease-modifying anti-rheumatic drugs (DMARDs). Hulio can be given as monotherapy in case of intolerance to methotrexate or when continued treatment with methotrexate is inappropriate (for the efficacy in monotherapy see section 5.1). Adalimumab has not been studied in patients aged less than 2 years.

Enthesitis-related arthritis

Hulio is indicated for the treatment of active enthesitis-related arthritis in patients, 6 years of age and older, who have had an inadequate response to, or who are intolerant of, conventional therapy (see section 5.1).

Paediatric plaque psoriasis

Hulio is indicated for the treatment of severe chronic plaque psoriasis in children and adolescents from 4 years of age who have had an inadequate response to or are inappropriate candidates for topical therapy and phototherapies.
Paediatric Crohn's disease

Hulio is indicated for the treatment of moderately to severely active Crohn's disease in paediatric patients (from 6 years of age) who have had an inadequate response to conventional therapy including primary nutrition therapy and a corticosteroid and/or an immunomodulator, or who are intolerant to or have contraindications for such therapies.

Adolescent hidradenitis suppurativa

Hulio is indicated for the treatment of active moderate to severe hidradenitis suppurativa (acne inversa) in adolescents from 12 years of age with an inadequate response to conventional systemic HS therapy (see sections 5.1 and 5.2).

Paediatric Uveitis

Hulio is indicated for the treatment of paediatric chronic non-infectious anterior uveitis in patients from 2 years of age who have had an inadequate response to or are intolerant to conventional therapy, or in whom conventional therapy is inappropriate.

4.2 Posology and method of administration

Hulio treatment should be initiated and supervised by specialist physicians experienced in the diagnosis and treatment of conditions for which Hulio is indicated. Ophthalmologists are advised to consult with an appropriate specialist before initiation of treatment with Hulio (see section 4.4). Patients treated with Hulio should be given the patient alert card.

After proper training in injection technique, patients may self-inject with Hulio if their physician determines that it is appropriate and with medical follow-up as necessary.

During treatment with Hulio, other concomitant therapies (e.g., corticosteroids and/or immunomodulatory agents) should be optimised.

Posology

Paediatric population

Juvenile idiopathic arthritis

Polyarticular juvenile idiopathic arthritis from 2 years of age

The recommended dose of Hulio for patients with polyarticular juvenile idiopathic arthritis from 2 years, of age is based on body weight (Table 1). Hulio is administered every other week via subcutaneous injection.

Table 1: Hulio Dose for Patients with Polyarticular Juvenile Idiopathic Arthritis

<table>
<thead>
<tr>
<th>Patient Weight</th>
<th>Dosing Regimen</th>
</tr>
</thead>
<tbody>
<tr>
<td>10 kg to &lt; 30 kg</td>
<td>20 mg every other week</td>
</tr>
<tr>
<td>≥ 30 kg</td>
<td>40 mg every other week</td>
</tr>
</tbody>
</table>

Available data suggest that clinical response is usually achieved within 12 weeks of treatment. Continued therapy should be carefully reconsidered in a patient not responding within this time period.

There is no relevant use of adalimumab in patients aged less than 2 years for this indication.
Hulio may be available in other presentations depending on the individual treatment needs.

**Enthesitis-related arthritis**

The recommended dose of Hulio for patients with enthesitis-related arthritis from 6 years of age is based on body weight (Table 2). Hulio is administered every other week via subcutaneous injection.

**Table 2: Hulio Dose for Patients with Enthesitis-Related Arthritis**

<table>

</tr>
<tr>
<td>≥ 30 kg</td>
<td>40 mg every other week</td>
</tr>
</tbody>
</table>

Adalimumab has not been studied in patients with enthesitis-related arthritis aged less than 6 years. Hulio may be available in other presentations depending on the individual treatment needs.

**Paediatric plaque psoriasis**

The recommended Hulio dose for patients with plaque psoriasis from 4 to 17 years of age is based on body weight (Table 3). Hulio is administered via subcutaneous injection.

**Table 3: Hulio Dose for Paediatric Patients with Plaque Psoriasis**

<table>
<thead>
<tr>

</tr>
</thead>
<tbody>
<tr>
<td>15 kg to &lt; 30 kg</td>
<td>Initial dose of 20 mg, followed by 20 mg given every other week starting one week after the initial dose</td>
</tr>
<tr>
<td>≥ 30 kg</td>
<td>Initial dose of 40 mg, followed by 40 mg given every other week starting one week after the initial dose</td>
</tr>
</tbody>
</table>

Continued therapy beyond 16 weeks should be carefully considered in a patient not responding within this time period.

If retreatment with Hulio is indicated, the above guidance on dose and treatment duration should be followed.

The safety of adalimumab in paediatric patients with plaque psoriasis has been assessed for a mean of 13 months.

There is no relevant use of adalimumab in children aged less than 4 years for this indication.

Hulio may be available in other presentations depending on the individual treatment needs.

**Adolescent hidradenitis suppurativa (from 12 years of age, weighing at least 30 kg)**

There are no clinical trials with adalimumab in adolescent patients with HS.

The posology of adalimumab in these patients has been determined from pharmacokinetic modelling and simulation (see section 5.2).

The recommended Hulio dose is 80 mg at week 0 followed by 40 mg every other week starting at week 1 via subcutaneous injection.
In adolescent patients with inadequate response to Hulio 40 mg every other week, an increase in dosage to 40 mg every week or 80 mg every other week may be considered.

Antibiotics may be continued during treatment with Hulio if necessary. It is recommended that the patient should use a topical antiseptic wash on their HS lesions on a daily basis during treatment with Hulio.

Continued therapy beyond 12 weeks should be carefully reconsidered in a patient with no improvement within this time period.

Should treatment be interrupted, Hulio may be re-introduced as appropriate.

The benefit and risk of continued long-term treatment should be periodically evaluated (see adult data in section 5.1).

There is no relevant use of adalimumab in children aged less than 6 years for this indication.

Hulio may be available in other presentations depending on the individual treatment needs.

**Paediatric Crohn's disease**

The recommended dose of Hulio for patients with Crohn’s disease from 6 to 17 years of age is based on body weight (Table 4). Hulio is administered via subcutaneous injection.

**Table 4: Hulio Dose for Paediatric Patients with Crohn’s disease**

<table>
<thead>
<tr>
<th>Patient Weight</th>
<th>Induction Dose</th>
<th>Maintenance Dose Starting at week 4</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt; 40 kg</td>
<td>• 40 mg at week 0 and 20 mg at week 2</td>
<td>20 mg every other week</td>
</tr>
<tr>
<td></td>
<td>In case there is a need for a more rapid response to therapy with the awareness that the risk for adverse events may be higher with use of the higher induction dose, the following dose may be used: • 80 mg at week 0 and 40 mg at week 2</td>
<td></td>
</tr>
<tr>
<td>≥ 40 kg</td>
<td>• 80 mg at week 0 and 40 mg at week 2</td>
<td>40 mg every other week</td>
</tr>
<tr>
<td></td>
<td>In case there is a need for a more rapid response to therapy with the awareness that the risk for adverse events may be higher with use of the higher induction dose, the following dose may be used: • 160 mg at week 0 and 80 mg at week 2</td>
<td></td>
</tr>
</tbody>
</table>

Patients who experience insufficient response may benefit from an increase in dosage:

- **< 40 kg**: 20 mg every week
- **≥ 40 kg**: 40 mg every week or 80 mg every other week

Continued therapy should be carefully considered in a subject not responding by week 12.

There is no relevant use of adalimumab in children aged less than 6 years for this indication.

Hulio may be available in other presentations depending on the individual treatment needs.
Paediatric Uveitis

The recommended dose of Hulio for paediatric patients with uveitis from 2 years of age is based on body weight (Table 5). Hulio is administered via subcutaneous injection.

In paediatric uveitis, there is no experience in the treatment with Hulio without concomitant treatment with methotrexate.

Table 5: Hulio Dose for Paediatric Patients with Uveitis

<table>

<td>40 mg every other week in combination with methotrexate</td>
</tr>
</tbody>
</table>

When Hulio therapy is initiated, a loading dose of 40 mg for patients < 30 kg or 80 mg for patients ≥ 30 kg may be administered one week prior to the start of maintenance therapy. No clinical data are available on the use of a Hulio loading dose in children < 6 years of age (see section 5.2).

There is no relevant use of adalimumab in children aged less than 2 years in this indication.

It is recommended that the benefit and risk of continued long-term treatment should be evaluated on a yearly basis (see section 5.1).

Hulio may be available in other presentations depending on the individual treatment needs.

Renal and/or hepatic impairment

Adalimumab has not been studied in these patient populations. No dose recommendations can be made.

Method of administration

Hulio is administered by subcutaneous injection. Full instructions for use are provided in the package leaflet.

A 40 mg pen and a 40 mg prefilled syringe are also available for patients to administer a full 40 mg dose.

4.3 Contraindications

Hypersensitivity to the active substance or to any of the excipients listed in section 6.1.

Active tuberculosis or other severe infections such as sepsis, and opportunistic infections (see section 4.4).

Moderate to severe heart failure (NYHA class III/IV) (see section 4.4).

4.4 Special warnings and precautions for use

Traceability

In order to improve traceability of biological medicinal products, the name and the batch number of the administered product should be clearly recorded.
Infections

Patients taking TNF-antagonists are more susceptible to serious infections. Impaired lung function may increase the risk for developing infections. Patients must therefore be monitored closely for infections, including tuberculosis, before, during and after treatment with Hulio. Because the elimination of adalimumab may take up to four months, monitoring should be continued throughout this period.

Treatment with Hulio should not be initiated in patients with active infections including chronic or localised infections until infections are controlled. In patients who have been exposed to tuberculosis and patients who have travelled in areas of high risk of tuberculosis or endemic mycoses, such as histoplasmosis, coccidioidomycosis, or blastomycosis, the risk and benefits of treatment with Hulio should be considered prior to initiating therapy (see Other opportunistic infections).

Patients who develop a new infection while undergoing treatment with Hulio, should be monitored closely and undergo a complete diagnostic evaluation. Administration of Hulio should be discontinued if a patient develops a new serious infection or sepsis, and appropriate antimicrobial or antifungal therapy should be initiated until the infection is controlled. Physicians should exercise caution when considering the use of Hulio in patients with a history of recurring infection or with underlying conditions which may predispose patients to infections, including the use of concomitant immunosuppressive medications.

Serious infections

Serious infections, including sepsis, due to bacterial, mycobacterial, invasive fungal, parasitic, viral, or other opportunistic infections such as listeriosis, legionellosis and pneumocystis have been reported in patients receiving adalimumab.

Other serious infections seen in clinical trials include pneumonia, pyelonephritis, septic arthritis and septicaemia. Hospitalisation or fatal outcomes associated with infections have been reported.

Tuberculosis

Tuberculosis, including reactivation and new onset of tuberculosis, has been reported in patients receiving adalimumab. Reports included cases of pulmonary and extra-pulmonary (i.e. disseminated) tuberculosis.

Before initiation of therapy with Hulio, all patients must be evaluated for both active or inactive (“latent”) tuberculosis infection. This evaluation should include a detailed medical assessment of patient history of tuberculosis or possible previous exposure to people with active tuberculosis and previous and/or current immunosuppressive therapy. Appropriate screening tests (i.e. tuberculin skin test and chest X-ray) should be performed in all patients (local recommendations may apply). It is recommended that the conduct and results of these tests are recorded in the patient alert card. Prescribers are reminded of the risk of false negative tuberculin skin test results, especially in patients who are severely ill or immunocompromised.

If active tuberculosis is diagnosed, Hulio therapy must not be initiated (see section 4.3).

In all situations described below, the benefit/risk balance of therapy should be very carefully considered.

If latent tuberculosis is suspected, a physician with expertise in the treatment of tuberculosis should be consulted.

If latent tuberculosis is diagnosed, appropriate treatment must be started with anti-tuberculosis prophylaxis treatment before the initiation of Hulio, and in accordance with local recommendations.
Use of anti-tuberculosis prophylaxis treatment should also be considered before the initiation of Hulio in patients with several or significant risk factors for tuberculosis despite a negative test for tuberculosis and in patients with a past history of latent or active tuberculosis in whom an adequate course of treatment cannot be confirmed.

Despite prophylactic treatment for tuberculosis, cases of reactivated tuberculosis have occurred in patients treated with adalimumab. Some patients who have been successfully treated for active tuberculosis have redeveloped tuberculosis while being treated with adalimumab.

Patients should be instructed to seek medical advice if signs/symptoms suggestive of a tuberculosis infection (e.g., persistent cough, wasting/weight loss, low grade fever, listlessness) occur during or after therapy with Hulio.

*Other opportunistic infections*

Opportunistic infections, including invasive fungal infections have been observed in patients receiving adalimumab. These infections have not consistently been recognised in patients taking TNF-antagonists and this has resulted in delays in appropriate treatment, sometimes resulting in fatal outcomes.

For patients who develop the signs and symptoms such as fever, malaise, weight loss, sweats, cough, dyspnoea, and/or pulmonary infiltrates or other serious systemic illness with or without concomitant shock an invasive fungal infection should be suspected and administration of Hulio should be promptly discontinued. Diagnosis and administration of empiric antifungal therapy in these patients should be made in consultation with a physician with expertise in the care of patients with invasive fungal infections.

**Hepatitis B reactivation**

 Reactivation of hepatitis B has occurred in patients receiving a TNF-antagonist including adalimumab, who are chronic carriers of this virus (i.e. surface antigen positive). Some cases have had a fatal outcome. Patients should be tested for HBV infection before initiating treatment with Hulio. For patients who test positive for hepatitis B infection, consultation with a physician with expertise in the treatment of hepatitis B is recommended.

Carriers of HBV who require treatment with Hulio should be closely monitored for signs and symptoms of active HBV infection throughout therapy and for several months following termination of therapy. Adequate data from treating patients who are carriers of HBV with anti-viral therapy in conjunction with TNF-antagonist therapy to prevent HBV reactivation are not available. In patients who develop HBV reactivation, Hulio should be stopped and effective anti-viral therapy with appropriate supportive treatment should be initiated.

**Neurological events**

TNF-antagonists including adalimumab have been associated in rare instances with new onset or exacerbation of clinical symptoms and/or radiographic evidence of central nervous system demyelinating disease including multiple sclerosis and optic neuritis, and peripheral demyelinating disease, including Guillain-Barré syndrome. Prescribers should exercise caution in considering the use of Hulio in patients with pre-existing or recent-onset central or peripheral nervous system demyelinating disorders; discontinuation of Hulio should be considered if any of these disorders develop. There is a known association between intermediate uveitis and central demyelinating disorders. Neurologic evaluation should be performed in patients with non-infectious intermediate uveitis prior to the initiation of Hulio therapy and regularly during treatment to assess for pre-existing or developing central demyelinating disorders.
Allergic reactions

Serious allergic reactions associated with adalimumab were rare during clinical trials. Non-serious allergic reactions associated with adalimumab were uncommon during clinical trials. Reports of serious allergic reactions including anaphylaxis have been received following adalimumab administration. If an anaphylactic reaction or other serious allergic reaction occurs, administration of Hulio should be discontinued immediately and appropriate therapy initiated.

Immunosuppression

In a study of 64 patients with rheumatoid arthritis that were treated with adalimumab, there was no evidence of depression of delayed-type hypersensitivity, depression of immunoglobulin levels, or change in enumeration of effector T-, B-, NK-cells, monocyte/macrophages, and neutrophils.

Malignancies and lymphoproliferative disorders

In the controlled portions of clinical trials of TNF-antagonists, more cases of malignancies including lymphoma have been observed among patients receiving a TNF-antagonist compared with control patients. However, the occurrence was rare. In the post marketing setting, cases of leukaemia have been reported in patients treated with a TNF-antagonist. There is an increased background risk for lymphoma and leukaemia in rheumatoid arthritis patients with long-standing highly active, inflammatory disease, which complicates the risk estimation. With the current knowledge, a possible risk for the development of lymphomas, leukaemia, and other malignancies in patients treated with a TNF-antagonist cannot be excluded.

Malignancies, some fatal, have been reported among children, adolescents and young adults (up to 22 years of age) treated with TNF-antagonists (initiation of therapy ≤ 18 years of age), including adalimumab in the post marketing setting. Approximately half the cases were lymphomas. The other cases represented a variety of different malignancies and included rare malignancies usually associated with immunosuppression. A risk for the development of malignancies in children and adolescents treated with TNF-antagonists cannot be excluded.

Rare postmarketing cases of hepatosplenic T-cell lymphoma have been identified in patients treated with adalimumab. This rare type of T-cell lymphoma has a very aggressive disease course and is usually fatal. Some of these hepatosplenic T-cell lymphomas with adalimumab have occurred in young adult patients on concomitant treatment with azathioprine or 6-mercaptopurine used for inflammatory bowel disease. The potential risk with the combination of azathioprine or 6-mercaptopurine and adalimumab should be carefully considered. A risk for the development of hepatosplenic T-cell lymphoma in patients treated with Hulio cannot be excluded (see section 4.8).

No studies have been conducted that include patients with a history of malignancy or in whom treatment with adalimumab is continued following development of malignancy. Thus, additional caution should be exercised in considering adalimumab treatment of these patients (see section 4.8).

All patients, and in particular patients with a medical history of extensive immunosuppressant therapy or psoriasis patients with a history of PUVA treatment should be examined for the presence of non-melanoma skin cancer prior to and during treatment with Hulio. Melanoma and Merkel cell carcinoma have also been reported in patients treated with TNF-antagonists including adalimumab (see section 4.8).

In an exploratory clinical trial evaluating the use of another TNF-antagonist, infliximab, in patients with moderate to severe chronic obstructive pulmonary disease (COPD), more malignancies, mostly in the lung or head and neck, were reported in infliximab-treated patients compared with control patients. All patients had a history of heavy smoking. Therefore, caution should be exercised when using any TNF-antagonist in COPD patients, as well as in patients with increased risk for malignancy due to heavy smoking.
With current data it is not known if adalimumab treatment influences the risk for developing dysplasia or colon cancer. All patients with ulcerative colitis who are at increased risk for dysplasia or colon carcinoma (for example, patients with long-standing ulcerative colitis or primary sclerosing cholangitis), or who had a prior history of dysplasia or colon carcinoma should be screened for dysplasia at regular intervals before therapy and throughout their disease course. This evaluation should include colonoscopy and biopsies per local recommendations.

**Haematologic reactions**

Rare reports of pancytopenia including aplastic anaemia have been reported with TNF-antagonists. Adverse events of the haematologic system, including medically significant cytopenia (e.g. thrombocytopenia, leucopenia) have been reported with adalimumab. All patients should be advised to seek immediate medical attention if they develop signs and symptoms suggestive of blood dyscrasias (e.g. persistent fever, bruising, bleeding, pallor) while on Hulio. Discontinuation of Hulio therapy should be considered in patients with confirmed significant haematologic abnormalities.

**Vaccinations**

Similar antibody responses to the standard 23-valent pneumococcal vaccine and the influenza trivalent virus vaccination were observed in a study in 226 adult subjects with rheumatoid arthritis who were treated with adalimumab or placebo. No data are available on the secondary transmission of infection by live vaccines in patients receiving adalimumab.

It is recommended that paediatric patients, if possible, be brought up to date with all immunisations in agreement with current immunisation guidelines prior to initiating adalimumab therapy.

Patients on adalimumab may receive concurrent vaccinations, except for live vaccines. Administration of live vaccines (e.g., BCG vaccine) to infants exposed to adalimumab in utero is not recommended for 5 months following the mother's last adalimumab injection during pregnancy.

**Congestive heart failure**

In a clinical trial with another TNF-antagonist worsening congestive heart failure and increased mortality due to congestive heart failure have been observed. Cases of worsening congestive heart failure have also been reported in patients receiving adalimumab. Hulio should be used with caution in patients with mild heart failure (NYHA class I/II). Hulio is contraindicated in moderate to severe heart failure (see section 4.3). Treatment with Hulio must be discontinued in patients who develop new or worsening symptoms of congestive heart failure.

**Autoimmune processes**

Treatment with Hulio may result in the formation of autoimmune antibodies. The impact of long-term treatment with adalimumab on the development of autoimmune diseases is unknown. If a patient develops symptoms suggestive of a lupus-like syndrome following treatment with Hulio and is positive for antibodies against double-stranded DNA, further treatment with Hulio should not be given (see section 4.8).

**Concurrent administration of biologic DMARDS or TNF-antagonists**

Serious infections were seen in clinical studies with concurrent use of anakinra and another TNF-antagonist, etanercept, with no added clinical benefit compared to etanercept alone. Because of the nature of the adverse events seen with the combination of etanercept and anakinra therapy, similar toxicities may also result from the combination of anakinra and other TNF-antagonists. Therefore, the combination of adalimumab and anakinra is not recommended. (See section 4.5).

Concomitant administration of adalimumab with other biologic DMARDS (e.g. anakinra and abatacept) or other TNF-antagonists is not recommended based upon the possible increased risk for
infections, including serious infections and other potential pharmacological interactions. (See section 4.5).

**Surgery**

There is limited safety experience of surgical procedures in patients treated with adalimumab. The long half-life of adalimumab should be taken into consideration if a surgical procedure is planned. A patient who requires surgery while on Hulio should be closely monitored for infections, and appropriate actions should be taken. There is limited safety experience in patients undergoing arthroplasty while receiving adalimumab.

**Small bowel obstruction**

Failure to respond to treatment for Crohn's disease may indicate the presence of fixed fibrotic stricture that may require surgical treatment. Available data suggest that adalimumab does not worsen or cause strictures.

**Elderly**

The frequency of serious infections among adalimumab treated subjects over 65 years of age (3.7%) was higher than for those under 65 years of age (1.5%). Some of those had a fatal outcome. Particular attention regarding the risk for infection should be paid when treating the elderly.

**Paediatric population**

See Vaccinations above.

**Excipients with known effect**

**Sorbitol**

This medicinal product contains sorbitol (E420). Patients with hereditary fructose intolerance (HFI) should not take/be given this medicinal product.

**Sodium**

This medicinal product contains less than 1 mmol of sodium (23 mg) per 0.8 ml dose, i.e. essentially ‘sodium-free’.

**4.5 Interaction with other medicinal products and other forms of interaction**

Adalimumab has been studied in rheumatoid arthritis, polyarticular juvenile idiopathic arthritis and psoriatic arthritis patients taking adalimumab as monotherapy and those taking concomitant methotrexate. Antibody formation was lower when adalimumab was given together with methotrexate in comparison with use as monotherapy. Administration of adalimumab without methotrexate resulted in increased formation of antibodies, increased clearance and reduced efficacy of adalimumab (see section 5.1).

The combination of Hulio and anakinra is not recommended (see section 4.4 “Concurrent administration of biologic DMARDs or TNF-antagonists”).

The combination of Hulio and abatacept is not recommended (see section 4.4 “Concurrent administration of biologic DMARDs or TNF-antagonists”).
4.6 Fertility, pregnancy and lactation

Women of child bearing potential

Women of childbearing potential should consider the use of adequate contraception to prevent pregnancy and continue its use for at least five months after the last Hulio treatment.

Pregnancy

A large number (approximately 2,100) of prospectively collected pregnancies exposed to adalimumab resulting in live birth with known outcomes, including more than 1,500 exposed during the first trimester, does not indicate an increase in the rate of malformation in the newborn.

In a prospective cohort registry, 257 women with rheumatoid arthritis (RA) or Crohn’s disease (CD) treated with adalimumab at least during the first trimester and 120 women with RA or CD not treated with adalimumab were enrolled. The primary endpoint was the birth prevalence of major birth defects. The rate of pregnancies ending with at least one live born infant with a major birth defect was 6/69 (8.7%) in the adalimumab-treated women with RA and 5/74 (6.8%) in the untreated women with RA (unadjusted OR 1.31, 95% CI 0.38-4.52) and 16/152 (10.5%) in the adalimumab-treated women with CD and 3/32 (9.4%) in the untreated women with CD (unadjusted OR 1.14, 95% CI 0.31-4.16). The adjusted OR (accounting for baseline differences) was 1.10 (95% CI 0.45-2.73) with RA and CD combined. There were no distinct differences between adalimumab-treated and untreated women for the secondary endpoints spontaneous abortions, minor birth defects, preterm delivery, birth size and serious or opportunistic infections and no stillbirths or malignancies were reported. The interpretation of data may be impacted due to methodological limitations of the study, including small sample size and non-randomized design.

In a developmental toxicity study conducted in monkeys, there was no indication of maternal toxicity, embryotoxicity or teratogenicity. Preclinical data on postnatal toxicity of adalimumab are not available (see section 5.3).

Due to its inhibition of TNFα, adalimumab administered during pregnancy could affect normal immune responses in the newborn. Adalimumab should only be used during pregnancy if clearly needed.

Adalimumab may cross the placenta into the serum of infants born to women treated with adalimumab during pregnancy. Consequently, these infants may be at increased risk for infection. Administration of live vaccines (e.g., BCG vaccine) to infants exposed to adalimumab in utero is not recommended for 5 months following the mother’s last adalimumab injection during pregnancy.

Breast feeding

Limited information from the published literature indicates that adalimumab is excreted in breast milk at very low concentrations with the presence of adalimumab in human milk at concentrations of 0.1% to 1% of the maternal serum level. Given orally, immunoglobulin G proteins undergo intestinal proteolysis and have poor bioavailability. No effects on the breastfed newborns/infants are anticipated. Consequently, adalimumab can be used during breastfeeding.

Fertility

Preclinical data on fertility effects of adalimumab are not available.

4.7 Effects on ability to drive and use machines

Hulio may have a minor influence on the ability to drive and use machines. Vertigo and visual impairment may occur following administration of Hulio (see section 4.8).
4.8 Undesirable effects

Summary of the safety profile

Adalimumab was studied in 9,506 patients in pivotal controlled and open label trials for up to 60 months or more. These trials included rheumatoid arthritis patients with short term and long standing disease, juvenile idiopathic arthritis (polyarticular juvenile idiopathic arthritis and enthesitis-related arthritis) as well as axial spondyloarthritis (ankylosing spondylitis and axial spondyloarthritis without radiographic evidence of AS), psoriatic arthritis, Crohn's disease, ulcerative colitis, psoriasis, hidradenitis suppurativa and uveitis patients. The pivotal controlled studies involved 6,089 patients receiving adalimumab and 3,801 patients receiving placebo or active comparator during the controlled period.

The proportion of patients who discontinued treatment due to adverse events during the double-blind, controlled portion of pivotal studies was 5.9% for patients taking adalimumab and 5.4% for control treated patients.

The most commonly reported adverse reactions are infections (such as nasopharyngitis, upper respiratory tract infection and sinusitis), injection site reactions (erythema, itching, haemorrhage, pain or swelling), headache and musculoskeletal pain.

Serious adverse reactions have been reported for adalimumab. TNF-antagonists, such as adalimumab affect the immune system and their use may affect the body's defence against infection and cancer.

Fatal and life-threatening infections (including sepsis, opportunistic infections and TB), HBV reactivation and various malignancies (including leukaemia, lymphoma and HSTCL) have also been reported with use of adalimumab.

Serious haematological, neurological and autoimmune reactions have also been reported. These include rare reports of pancytopenia, aplastic anaemia, central and peripheral demyelinating events and reports of lupus, lupus-related conditions and Stevens-Johnson syndrome.

Paediatric population

In general, the adverse events in paediatric patients were similar in frequency and type to those seen in adult patients.

Tabulated list of adverse reactions

The following list of adverse reactions is based on experience from clinical trials and on postmarketing experience and are displayed by system organ class and frequency in Table 6 below: very common (≥ 1/10); common (≥ 1/100 to < 1/10); uncommon (≥ 1/1,000 to < 1/100); rare (≥ 1/10,000 to < 1/1,000); and not known (cannot be estimated from the available data). Within each frequency grouping, undesirable effects are presented in order of decreasing seriousness. The highest frequency seen among the various indications has been included. An asterisk (*) appears in the System Organ Class (SOC) column if further information is found elsewhere in sections 4.3, 4.4 and 4.8.

* further information is found elsewhere in sections 4.3, 4.4 and 4.8
** including open label extension studies
$^1$ including spontaneous reporting data
**Hidradenitis suppurativa**

The safety profile for patients with HS treated with adalimumab weekly was consistent with the known safety profile of adalimumab.

**Uveitis**

The safety profile for patients with uveitis treated with adalimumab every other week was consistent with the known safety profile of adalimumab.

**Description of selected adverse reactions**

**Injection site reactions**

In the pivotal controlled trials in adults and children, 12.9% of patients treated with adalimumab developed injection site reactions (erythema and/or itching, haemorrhage, pain or swelling), compared to 7.2% of patients receiving placebo or active control. Injection site reactions generally did not necessitate discontinuation of the medicinal product.

**Infections**

In the pivotal controlled trials in adults and children, the rate of infection was 1.51 per patient year in the adalimumab treated patients and 1.46 per patient year in the placebo and active control-treated patients. The infections consisted primarily of nasopharyngitis, upper respiratory tract infection, and sinusitis. Most patients continued on adalimumab after the infection resolved.

The incidence of serious infections was 0.04 per patient year in adalimumab treated patients and 0.03 per patient year in placebo and active control - treated patients.

In controlled and open label adult and paediatric studies with adalimumab, serious infections (including fatal infections, which occurred rarely) have been reported, which include reports of tuberculosis (including miliary and extra-pulmonary locations) and invasive opportunistic infections (e.g. disseminated or extrapulmonary histoplasmosis, blastomycosis, coccidiodomycosis, pneumocystis candidiasis, aspergillosis and listeriosis). Most of the cases of tuberculosis occurred within the first eight months after initiation of therapy and may reflect recrudescence of latent disease.

**Malignancies and lymphoproliferative disorders**

No malignancies were observed in 249 paediatric patients with an exposure of 655.6 patient years during adalimumab trials in patients with juvenile idiopathic arthritis (polyarticular juvenile idiopathic arthritis and enthesitis-related arthritis). In addition, no malignancies were observed in 192 paediatric patients with an exposure of 498.1 patient years during adalimumab trials in paediatric patients with Crohn's disease. No malignancies were observed in 77 paediatric patients with an exposure of 80.0 patient years during an adalimumab trial in paediatric patients with chronic plaque psoriasis. No malignancies were observed in 60 paediatric patients with an exposure of 58.4 patient years during an adalimumab trial in paediatric patients with uveitis.

During the controlled portions of pivotal adalimumab trials in adults of at least 12 weeks in duration in patients with moderately to severely active rheumatoid arthritis, ankylosing spondylitis, axial spondyloarthritis without radiographic evidence of AS, psoriatic arthritis, psoriasis, hidradenitis suppurativa, Crohn's disease, ulcerative colitis and uveitis, malignancies, other than lymphoma and non-melanoma skin cancer, were observed at a rate (95% confidence interval) of 6.8 (4.4, 10.5) per 1,000 patient-years among 5,291 adalimumab treated patients versus a rate of 6.3 (3.4, 11.8) per 1,000 patient-years among 3,444 control patients (median duration of treatment was 4.0 months for adalimumab and 3.8 months for control-treated patients). The rate (95% confidence interval) of non-melanoma skin cancers was 8.8 (6.0, 13.0) per 1,000 patient-years among adalimumab-treated patients and 3.2 (1.3, 7.6) per 1,000 patient-years among control patients. Of these skin cancers, squamous cell
carcinomas occurred at rates (95% confidence interval) of 2.7 (1.4, 5.4) per 1,000 patient-years among adalimumab-treated patients and 0.6 (0.1, 4.5) per 1,000 patient-years among control patients. The rate (95% confidence interval) of lymphomas was 0.7 (0.2, 2.7) per 1,000 patient-years among adalimumab-treated patients and 0.6 (0.1, 4.5) per 1,000 patient-years among control patients.

When combining controlled portions of these trials and ongoing and completed open label extension studies with a median duration of approximately 3.3 years including 6,427 patients and over 26,439 patient-years of therapy, the observed rate of malignancies, other than lymphoma and non-melanoma skin cancers is approximately 8.5 per 1,000 patient-years. The observed rate of non-melanoma skin cancers is approximately 9.6 per 1,000 patient years, and the observed rate of lymphomas is approximately 1.3 per 1,000 patient years.

In post-marketing experience from January 2003 to December 2010, predominantly in patients with rheumatoid arthritis, the reported rate of malignancies is approximately 2.7 per 1,000 patient treatment years. The reported rates for non-melanoma skin cancers and lymphomas are approximately 0.2 and 0.3 per 1,000 patient treatment years, respectively (see section 4.4).

Rare post-marketing cases of hepatosplenic T-cell lymphoma have been reported in patients treated with adalimumab (see section 4.4).

**Autoantibodies**

Patients had serum samples tested for autoantibodies at multiple time points in rheumatoid arthritis studies I – V. In these trials, 11.9% of patients treated with adalimumab and 8.1% of placebo and active control – treated patients that had negative baseline anti-nuclear antibody titres reported positive titres at week 24. Two patients out of 3,441 treated with adalimumab in all rheumatoid arthritis and psoriatic arthritis studies developed clinical signs suggestive of new-onset lupus-like syndrome. The patients improved following discontinuation of therapy. No patients developed lupus nephritis or central nervous system symptoms.

**Hepato-biliary events**

In controlled Phase 3 trials of adalimumab in patients with rheumatoid arthritis and psoriatic arthritis with a control period duration ranging from 4 to 104 weeks, ALT elevations ≥ 3 x ULN occurred in 3.7% of adalimumab-treated patients and 1.6% of control-treated patients.

In controlled Phase 3 trials of adalimumab in patients with polyarticular juvenile idiopathic arthritis who were 4 to 17 years and enthesitis-related arthritis who were 6 to 17 years, ALT elevations ≥ 3 x ULN occurred in 6.1% of adalimumab-treated patients and 1.3% of control-treated patients. Most ALT elevations occurred with concomitant methotrexate use. No ALT elevations ≥ 3 x ULN occurred in the Phase 3 trial of adalimumab in patients with polyarticular juvenile idiopathic arthritis who were 2 to <4 years.

In controlled Phase 3 trials of adalimumab in patients with Crohn's disease and ulcerative colitis with a control period ranging from 4 to 52 weeks. ALT elevations ≥ 3 x ULN occurred in 0.9% of adalimumab-treated patients and 0.9% of controlled-treated patients.

In the Phase 3 trial of adalimumab in patients with paediatric Crohn's disease which evaluated efficacy and safety of two body weight adjusted maintenance dose regimens following body weight adjusted induction therapy up to 52 weeks of treatment, ALT elevations ≥ 3 x ULN occurred in 2.6% (5/192) of patients of whom 4 were receiving concomitant immunosuppressants at baseline.

In controlled Phase 3 trials of adalimumab in patients with plaque psoriasis with a control period duration ranging from 12 to 24 weeks, ALT elevations ≥ 3 x ULN occurred in 1.8% of adalimumab-treated patients and 1.8% of control-treated patients.
No ALT elevations ≥3 X ULN occurred in the Phase 3 trial of adalimumab in paediatric patients with plaque psoriasis.

In controlled trials of adalimumab (initial doses of 160 mg at week 0 and 80 mg at week 2, followed by 40 mg every week starting at week 4), in patients with hidradenitis suppurativa with a control period duration ranging from 12 to 16 weeks, ALT elevations ≥ 3 x ULN occurred in 0.3% of adalimumab-treated patients and 0.6% of control-treated patients.

In controlled trials of adalimumab (initial doses of 80 mg at week 0 followed by 40 mg every other week starting at week 1) in adult patients with uveitis up to 80 weeks with a median exposure of 166.5 days and 105.0 days in adalimumab-treated and control-treated patients, respectively, ALT elevations ≥ 3 x ULN occurred in 2.4% of adalimumab-treated patients and 2.4% of control-treated patients.

Across all indications in clinical trials patients with raised ALT were asymptomatic and in most cases elevations were transient and resolved on continued treatment. However, there have also been post-marketing reports of liver failure as well as less severe liver disorders that may precede liver failure, such as hepatitis including autoimmune hepatitis in patients receiving adalimumab.

Concurrent treatment with azathioprine/6-mercaptopurine

In adult Crohn's disease studies, higher incidences of malignant and serious infection-related adverse events were seen with the combination of adalimumab and azathioprine/6-mercaptopurine compared with adalimumab alone.

4.9 Overdose

No dose-limiting toxicity was observed during clinical trials. The highest dose level evaluated has been multiple intravenous doses of 10 mg/kg, which is approximately 15 times the recommended dose.

5. PHARMACOLOGICAL PROPERTIES

5.1 Pharmacodynamic properties

Pharmacotherapeutic group: Immunosuppressants, Tumour Necrosis Factor alpha (TNF-α) inhibitors.
ATC code: L04AB04

Mechanism of action

Adalimumab binds specifically to TNF and neutralises the biological function of TNF by blocking its interaction with the p55 and p75 cell surface TNF receptors.

Adalimumab also modulates biological responses that are induced or regulated by TNF, including changes in the levels of adhesion molecules responsible for leukocyte migration (ELAM-1, VCAM-1, and ICAM-1 with an IC₅₀ of 0.1-0.2 nM).
Pharmacodynamic effects

After treatment with adalimumab, a rapid decrease in levels of acute phase reactants of inflammation (C-reactive protein (CRP) and erythrocyte sedimentation rate (ESR)) and serum cytokines (IL-6) was observed, compared to baseline in patients with rheumatoid arthritis. Serum levels of matrix metalloproteinases (MMP-1 and MMP-3) that produce tissue remodelling responsible for cartilage destruction were also decreased after adalimumab administration. Patients treated with adalimumab usually experienced improvement in haematological signs of chronic inflammation.

A rapid decrease in CRP levels was also observed in patients with polyarticular juvenile idiopathic arthritis, Crohn’s disease, ulcerative colitis and hidradenitis suppurativa after treatment with adalimumab. In patients with Crohn’s disease, a reduction of the number of cells expressing inflammatory markers in the colon including a significant reduction of expression of TNFα was seen. Endoscopic studies in intestinal mucosa have shown evidence of mucosal healing in adalimumab treated patients.

Clinical efficacy and safety

Juvenile idiopathic arthritis (JIA)

Polyarticular juvenile idiopathic arthritis (pJIA)

The safety and efficacy of adalimumab was assessed in two studies (pJIA I and II) in children with active polyarticular or polyarticular course juvenile idiopathic arthritis, who had a variety of JIA onset types (most frequently rheumatoid-factor negative or positive polyarthritis and extended oligoarthritis).

pJIA I

The safety and efficacy of adalimumab were assessed in a multicentre, randomised, double-blind, parallel-group study in 171 children (4-17 years old) with polyarticular JIA. In the open-label lead in phase (OL LI) patients were stratified into two groups, MTX (methotrexate)-treated or non-MTX-treated. Patients who were in the non-MTX stratum were either naïve to or had been withdrawn from MTX at least two weeks prior to study drug administration. Patients remained on stable doses of NSAIDs and or prednisone (≤ 0.2 mg/kg/day or 10 mg/day maximum). In the OL LI phase all patients received 24 mg/m² up to a maximum of 40 mg adalimumab every other week for 16 weeks. The distribution of patients by age and minimum, median and maximum dose received during the OL LI phase is presented in Table 7.

Table 7: Distribution of patients by age and adalimumab dose received during the OL LI phase

Patients demonstrating a Pediatric ACR 30 response at week 16 were eligible to be randomised into the double blind (DB) phase and received either adalimumab 24 mg/m² up to a maximum of 40 mg, or placebo every other week for an additional 32 weeks or until disease flare. Disease flare criteria were defined as a worsening of ≥ 30% from baseline in ≥ 3 of 6 Pediatric ACR core criteria, ≥ 2 active joints, and improvement of > 30% in no more than 1 of the 6 criteria. After 32 weeks or at disease flare, patients were eligible to enrol into the open label extension phase.

\(^a\) Ped ACR 30/50/70 responses week 48 significantly greater than those of placebo treated patients
\(^b\) \(p = 0.015\)
\(^c\) \(p = 0.031\)

Amongst those who responded at week 16 (n=144), the Pediatric ACR 30/50/70/90 responses were maintained for up to six years in the OLE phase in patients who received adalimumab throughout the study. Over all 19 subjects, of which 11 of the baseline age group 4 to 12 and 8 of the baseline age group 13 to 17 years were treated 6 years or longer.

Overall responses were generally better and, fewer patients developed antibodies when treated with the combination of adalimumab and MTX compared to adalimumab alone. Taking these results into consideration, adalimumab is recommended for use in combination with MTX and for use as monotherapy in patients for whom MTX use is not appropriate (see section 4.2).

**pJIA II**

The safety and efficacy of adalimumab was assessed in an open-label, multicentre study in 32 children (2 - <4 years old or aged 4 and above weighing < 15 kg) with moderately to severely active polyarticular JIA. The patients received 24 mg/m\(^2\) body surface area (BSA) of adalimumab up to a maximum of 20 mg every other week as a single dose via SC injection for at least 24 weeks. During the study, most subjects used concomitant MTX, with fewer reporting use of corticosteroids or NSAIDs.

At week 12 and week 24, PedACR30 response was 93.5% and 90.0%, respectively, using the observed data approach. The proportions of subjects with PedACR50/70/90 at week 12 and week 24 were 90.3%/61.3%/38.7% and 83.3%/73.3%/36.7%, respectively. Amongst those who responded (Pediatric ACR 30) at week 24 (n=27 out of 30 patients), the Pediatric ACR 30 responses were maintained for up to 60 weeks in the OLE phase in patients who received adalimumab throughout this time period. Overall, 20 subjects were treated for 60 weeks or longer.

**Enthesitis-related arthritis**

The safety and efficacy of adalimumab were assessed in a multicentre, randomised, double-blind study in 46 paediatric patients (6 to 17 years old) with moderate enthesitis-related arthritis. Patients were randomised to receive either 24 mg/m\(^2\) body surface area (BSA) of adalimumab up to a maximum of 40 mg, or placebo every other week for 12 weeks. The double-blind period is followed by an open-label (OL) period during which patients received 24 mg/m\(^2\) BSA of adalimumab up to a maximum of 40 mg every other week subcutaneously for up to an additional 192 weeks. The primary endpoint was the percent change from Baseline to week 12 in the number of active joints with arthritis (swelling not
due to deformity or joints with loss of motion plus pain and/or tenderness), which was achieved with mean percent decrease of -62.6% (median percent change -88.9%) in patients in the adalimumab group compared to -11.6% (median percent change -50.0%) in patients in the placebo group. Improvement in number of active joints with arthritis was maintained during the OL period through week 156 for the 26 of 31 (84%) patients in the adalimumab group who remained in the study. Although not statistically significant, the majority of patients demonstrated clinical improvement in secondary endpoints such as number of sites of enthesitis, tender joint count (TJC), swollen joint count (SJC), Pediatric ACR 50 response, and Pediatric ACR 70 response.

Adults with rheumatoid arthritis

Adalimumab was evaluated in over 3,000 patients in all rheumatoid arthritis clinical trials. The efficacy and safety of adalimumab were assessed in five randomised, double-blind and well-controlled studies. Some patients were treated for up to 120 months duration.

RA study I evaluated 271 patients with moderately to severely active rheumatoid arthritis who were ≥ 18 years old, had failed therapy with at least one disease-modifying, anti rheumatic drug and had insufficient efficacy with methotrexate at doses of 12.5 to 25 mg (10 mg if methotrexate-intolerant) every week and whose methotrexate dose remained constant at 10 to 25 mg every week. Doses of 20, 40 or 80 mg of adalimumab or placebo were given every other week for 24 weeks.

RA study II evaluated 544 patients with moderately to severely active rheumatoid arthritis who were ≥ 18 years old and had failed therapy with at least one disease-modifying, anti-rheumatic drugs. Doses of 20 or 40 mg of adalimumab were given by subcutaneous injection every other week with placebo on alternative weeks or every week for 26 weeks; placebo was given every week for the same duration. No other disease-modifying anti-rheumatic drugs were allowed.

RA study III evaluated 619 patients with moderately to severely active rheumatoid arthritis who were ≥ 18 years old, and who had an ineffective response to methotrexate at doses of 12.5 to 25 mg or have been intolerant to 10 mg of methotrexate every week. There were three groups in this study. The first received placebo injections every week for 52 weeks. The second received 20 mg of adalimumab every week for 52 weeks. The third group received 40 mg of adalimumab every other week with placebo injections on alternate weeks. Upon completion of the first 52 weeks, 457 patients enrolled in an open-label extension phase in which 40 mg of adalimumab/MTX was administered every other week up to 10 years.

RA study IV primarily assessed safety in 636 patients with moderately to severely active rheumatoid arthritis who were ≥ 18 years old. Patients were permitted to be either disease-modifying, anti-rheumatic drug-naïve or to remain on their pre-existing rheumatologic therapy provided that therapy was stable for a minimum of 28 days. These therapies include methotrexate, leflunomide, hydroxychloroquine, sulfasalazine and/or gold salts. Patients were randomised to 40 mg of adalimumab or placebo every other week for 24 weeks.

RA study V evaluated 799 methotrexate-naïve, adult patients with moderate to severely active early rheumatoid arthritis (mean disease duration less than 9 months). This study evaluated the efficacy of adalimumab 40 mg every other week/methotrexate combination therapy, adalimumab 40 mg every other week monotherapy and methotrexate monotherapy in reducing the signs and symptoms and rate of progression of joint damage in rheumatoid arthritis for 104 weeks. Upon completion of the first 104 weeks, 497 patients enrolled in an open-label extension phase in which 40 mg of adalimumab was administered every other week up to 10 years.

The primary end point in RA studies I, II and III and the secondary endpoint in RA study IV was the percent of patients who achieved an ACR 20 response at week 24 or 26. The primary endpoint in RA study V was the percent of patients who achieved an ACR 50 response at week 52. RA studies III and V had an additional primary endpoint at 52 weeks of retardation of disease progression (as detected by X-ray results). RA study III also had a primary endpoint of changes in quality of life.
ACR response

The percent of adalimumab-treated patients achieving ACR 20, 50 and 70 responses was consistent across RA studies I, II and III. The results for the 40 mg every other week dose are summarised in Table 9.

\(^b\) 40 mg adalimumab administered every other week
\(^c\) MTX = methotrexate
**p < 0.01, adalimumab versus placebo

In RA studies I-IV, all individual components of the ACR response criteria (number of tender and swollen joints, physician and patient assessment of disease activity and pain, disability index (HAQ) scores and CRP (mg/dl) values) improved at 24 or 26 weeks compared to placebo. In RA study III, these improvements were maintained throughout 52 weeks.

In the open-label extension for RA study III, most patients who were ACR responders maintained response when followed for up to 10 years. Of 207 patients who were randomised to adalimumab 40 mg every other week for 5 years. Among those, 86 patients (75.4%) had ACR 20 responses; 72 patients (63.2%) had ACR 50 responses; and 41 patients (36%) had ACR 70 responses. Of 207 patients, 81 patients continued on adalimumab 40 mg every other week for 10 years. Among those, 64 patients (79.0%) had ACR 20 responses; 56 patients (69.1%) had ACR 50 responses; and 43 patients (53.1%) had ACR 70 responses.

In RA study IV, the ACR 20 response of patients treated with adalimumab plus standard of care was statistically significantly better than patients treated with placebo plus standard of care (p < 0.001).

In RA studies I-IV, adalimumab-treated patients achieved statistically significant ACR 20 and 50 responses compared to placebo as early as one to two weeks after initiation of treatment.

In RA study V with early rheumatoid arthritis patients who were methotrexate naive, combination therapy with adalimumab and methotrexate led to faster and significantly greater ACR responses than methotrexate monotherapy and adalimumab monotherapy at week 52 and responses were sustained at week 104 (see Table 10).

<sup>a</sup> p-value is from the pairwise comparison of methotrexate monotherapy and adalimumab/methotrexate combination therapy using the Mann-Whitney U test.

<sup>b</sup> p-value is from the pairwise comparison of adalimumab monotherapy and adalimumab/methotrexate combination therapy using the Mann-Whitney U test.

<sup>c</sup> p-value is from the pairwise comparison of adalimumab monotherapy and methotrexate monotherapy using the Mann-Whitney U test.

In the open-label extension for RA study V, ACR response rates were maintained when followed for up to 10 years. Of 542 patients who were randomised to adalimumab 40 mg every other week, 170 patients continued on adalimumab 40 mg every other week for 10 years. Among those, 154 patients (90.6%) had ACR 20 responses; 127 patients (74.7%) had ACR 50 responses; and 102 patients (60.0%) had ACR 70 responses.

At week 52, 42.9% of patients who received adalimumab/methotrexate combination therapy achieved clinical remission (DAS28 (CRP) < 2.6) compared to 20.6% of patients receiving methotrexate monotherapy and 23.4% of patients receiving adalimumab monotherapy. Adalimumab/methotrexate combination therapy was clinically and statistically superior to methotrexate (p < 0.001) and adalimumab monotherapy (p < 0.001) in achieving a low disease state in patients with recently diagnosed moderate to severe rheumatoid arthritis. The response for the two monotherapy arms was similar (p = 0.447). Of 342 subjects originally randomised to adalimumab monotherapy or adalimumab/methotrexate combination therapy who entered the open-label extension study, 171 subjects completed 10 years of adalimumab treatment. Among those, 109 subjects (63.7%) were reported to be in remission at 10 years.

**Radiographic response**

In RA study III, where adalimumab treated patients had a mean duration of rheumatoid arthritis of approximately 11 years, structural joint damage was assessed radiographically and expressed as change in modified Total Sharp Score (TSS) and its components, the erosion score and joint space narrowing score. Adalimumab/methotrexate patients demonstrated significantly less radiographic progression than patients receiving methotrexate alone at 6 and 12 months (see Table 11).

In the open-label extension of RA Study III, the reduction in rate of progression of structural damage is maintained for 8 and 10 years in a subset of patients. At 8 years, 81 of 207 patients originally treated with 40 mg adalimumab every other week were evaluated radiographically. Among those, 48 patients showed no progression of structural damage defined by a change from baseline in the mTSS of 0.5 or less. At 10 years, 79 of 207 patients originally treated with 40 mg adalimumab every other week were evaluated radiographically. Among those, 40 patients showed no progression of structural damage defined by a change from baseline in the mTSS of 0.5 or less.

\(^c\) p-value is from the pairwise comparison of adalimumab monotherapy and methotrexate monotherapy using the Mann-Whitney U test

Following 52 weeks and 104 weeks of treatment, the percentage of patients without progression (change from baseline in modified Total Sharp Score ≤ 0.5) was significantly higher with adalimumab/methotrexate combination therapy (63.8% and 61.2% respectively) compared to methotrexate monotherapy (37.4% and 33.5% respectively, p < 0.001) and adalimumab monotherapy (50.7%, p < 0.002 and 44.5%, p < 0.001 respectively).

In the open-label extension of RA study V, the mean change from baseline at Year 10 in the modified Total Sharp Score was 10.8, 9.2 and 3.9 in patients originally randomised to methotrexate monotherapy, adalimumab monotherapy and adalimumab/methotrexate combination therapy, respectively. The corresponding proportions of patients with no radiographic progression were 31.3%, 23.7% and 36.7% respectively.

Quality of life and physical function

Health-related quality of life and physical function were assessed using the disability index of the Health Assessment Questionnaire (HAQ) in the four original adequate and well-controlled trials, which was a pre-specified primary endpoint at week 52 in RA study III. All doses/schedules of adalimumab in all four studies showed statistically significantly greater improvement in the disability index of the HAQ from baseline to Month 6 compared to placebo and in RA study III the same was
seen at week 52. Results from the Short Form Health Survey (SF 36) for all doses/schedules of adalimumab in all four studies support these findings, with statistically significant physical component summary (PCS) scores, as well as statistically significant pain and vitality domain scores for the 40 mg every other week dose. A statistically significant decrease in fatigue as measured by functional assessment of chronic illness therapy (FACIT) scores was seen in all three studies in which it was assessed (RA studies I, III, IV).

In RA study III, most subjects who achieved improvement in physical function and continued treatment maintained improvement through week 520 (120 months) of open-label treatment. Improvement in quality of life was measured up to week 156 (36 months) and improvement was maintained through that time.

In RA study V, the improvement in the HAQ disability index and the physical component of the SF 36 showed greater improvement (p < 0.001) for adalimumab/methotrexate combination therapy versus methotrexate monotherapy and adalimumab monotherapy at week 52, which was maintained through week 104. Among the 250 subjects who completed the open-label extension study, improvements in physical function were maintained through 10 years of treatment.

**Paediatric plaque psoriasis**

The efficacy of adalimumab was assessed in a randomised, double-blind, controlled study of 114 paediatric patients from 4 years of age with severe chronic plaque psoriasis (as defined by a Physician’s Global Assessment (PGA) ≥ 4 or > 20% BSA involvement or > 10% BSA involvement with very thick lesions or Psoriasis Area and Severity Index (PASI) ≥ 20 or ≥ 10 with clinically relevant facial, genital, or hand/foot involvement) who were inadequately controlled with topical therapy and phototherapy.

Patients received adalimumab 0.8 mg/kg eow (up to 40 mg), 0.4 mg/kg eow (up to 20 mg), or methotrexate 0.1 – 0.4 mg/kg weekly (up to 25 mg). At week 16, more patients randomised to adalimumab 0.8 mg/kg had positive efficacy responses (e.g., PASI 75) than those randomised to 0.4 mg/kg eow or MTX.

</tbody>
</table>

a MTX = methotrexate  
^b P=0.027, adalimumab 0.8 mg/kg versus MTX  
^c P=0.083, adalimumab 0.8 mg/kg versus MTX

Patients who achieved PASI 75 and PGA clear or minimal were withdrawn from treatment for up to 36 weeks and monitored for loss of disease control (i.e. a worsening of PGA by at least 2 grades). Patients were then re-treated with adalimumab 0.8 mg/kg eow for an additional 16 weeks and response rates observed during retreatment were similar to the previous double-blind period: PASI 75 response of 78.9% (15 of 19 subjects) and PGA clear or minimal of 52.6% (10 of 19 subjects).

In the open label period of the study, PASI 75 and PGA clear or minimal responses were maintained for up to an additional 52 weeks with no new safety findings.

**Adult plaque psoriasis**

The safety and efficacy of adalimumab were studied in adult patients with chronic plaque psoriasis (≥ 10% BSA involvement and PASI ≥ 12 or ≥ 10) who were candidates for systemic therapy or phototherapy in randomised, double-blind studies. 73% of patients enrolled in Psoriasis Studies I and
II had received prior systemic therapy or phototherapy. The safety and efficacy of adalimumab were also studied in adult patients with moderate to severe chronic plaque psoriasis with concomitant hand and/or foot psoriasis who were candidates for systemic therapy in a randomised double-blind study (Psoriasis Study III).

Psoriasis Study I (REVEAL) evaluated 1,212 patients within three treatment periods. In period A, patients received placebo or adalimumab at an initial dose of 80 mg followed by 40 mg every other week starting one week after the initial dose. After 16 weeks of therapy, patients who achieved at least a PASI 75 response (PASI score improvement of at least 75% relative to baseline), entered period B and received open-label 40 mg adalimumab every other week. Patients who maintained ≥PASI 75 response at week 33 and were originally randomised to active therapy in period A, were re-randomised in period C to receive 40 mg adalimumab every other week or placebo for an additional 19 weeks. Across all treatment groups, the mean baseline PASI score was 18.9 and the baseline PGA score ranged from “moderate” (53% of subjects included) to “severe” (41%) to “very severe” (6%).

Psoriasis Study II (CHAMPION) compared the efficacy and safety of adalimumab versus methotrexate and placebo in 271 patients. Patients received placebo, an initial dose of MTX 7.5 mg and thereafter dose increases up to week 12, with a maximum dose of 25 mg or an initial dose of 80 mg adalimumab followed by 40 mg every other week (starting one week after the initial dose) for 16 weeks. There are no data available comparing adalimumab and MTX beyond 16 weeks of therapy. Patients receiving MTX who achieved a ≥PASI 50 response at week 8 and/or 12 did not receive further dose increases. Across all treatment groups, the mean baseline PASI score was 19.7 and the baseline PGA score ranged from “mild” (<1%) to “moderate” (48%) to “severe” (46%) to “very severe” (6%).

Patients participating in all Phase 2 and Phase 3 psoriasis studies were eligible to enrol into an open-label extension trial, where adalimumab was given for at least an additional 108 weeks.

In Psoriasis Studies I and II, a primary endpoint was the proportion of patients who achieved a PASI 75 response from baseline at week 16 (see Tables 14 and 15).

*a p<0.001 adalimumab vs. placebo
*b p<0.001 adalimumab vs. methotrexate
'p<0.01 adalimumab vs. placebo
'd p<0.05 adalimumab vs. methotrexate

In Psoriasis Study I, 28% of patients who were PASI 75 responders and were re-randomised to placebo at week 33 compared to 5% continuing on adalimumab, p<0.001, experienced “loss of adequate response” (PASI score after week 33 and on or before week 52 that resulted in a <PASI 50 response relative to baseline with a minimum of a 6-point increase in PASI score relative to week 33). Of the patients who lost adequate response after re-randomisation to placebo who then enrolled into the open-label extension trial, 38% (25/66) and 55% (36/66) regained PASI 75 response after 12 and 24 weeks of re-treatment, respectively.

A total of 233 PASI 75 responders at week 16 and week 33 received continuous adalimumab therapy for 52 weeks in Psoriasis Study I, and continued adalimumab in the open-label extension trial. PASI 75 and PGA of clear or minimal response rates in these patients were 74.7% and 59.0%, respectively, after an additional 108 weeks of open-label therapy (total of 160 weeks). In an analysis in which all patients who dropped out of the study for adverse events or lack of efficacy, or who dose-escalated, were considered non-responders, PASI 75 and PGA of clear or minimal response rates in these patients were 69.6% and 55.7%, respectively, after an additional 108 weeks of open-label therapy (total of 160 weeks).

A total of 347 stable responders participated in a withdrawal and retreatment evaluation in an open-label extension study. During the withdrawal period, symptoms of psoriasis returned over time with a median time to relapse (decline to PGA “moderate” or worse) of approximately 5 months. None of these patients experienced rebound during the withdrawal period. A total of 76.5% (218/285) of patients who entered the retreatment period had a response of PGA “clear” or “minimal” after 16 weeks of retreatment, irrespective of whether they relapsed during withdrawal (69.1%^{123/178} and 88.8%[^95/107] for patients who relapsed and who did not relapse during the withdrawal period, respectively). A similar safety profile was observed during retreatment as before withdrawal.

Significant improvements at week 16 from baseline compared to placebo (Studies I and II) and MTX (Study II) were demonstrated in the DLQI (Dermatology Life Quality Index). In Study I, improvements in the physical and mental component summary scores of the SF-36 were also significant compared to placebo.

In an open-label extension study, for patients who dose escalated from 40 mg every other week to 40 mg weekly due to a PASI response below 50%, 26.4% (92/349) and 37.8% (132/349) of patients achieved PASI 75 response at week 12 and 24, respectively.

Psoriasis Study III (REACH) compared the efficacy and safety of adalimumab versus placebo in 72 patients with moderate to severe chronic plaque psoriasis and hand and/or foot psoriasis. Patients received an initial dose of 80 mg adalimumab followed by 40 mg every other week (starting one week after the initial dose) or placebo for 16 weeks. At week 16, a statistically significantly greater proportion of patients who received adalimumab achieved PGA of ‘clear’ or ‘almost clear’ for the hands and/or feet compared to patients who received placebo (30.6% versus 4.3%, respectively [P = 0.014]).

Psoriasis Study IV compared efficacy and safety of adalimumab versus placebo in 217 adult patients with moderate to severe nail psoriasis. Patients received an initial dose of 80 mg adalimumab followed...
by 40 mg every other week (starting one week after the initial dose) or placebo for 26 weeks followed by open-label adalimumab treatment for an additional 26 weeks. Nail psoriasis assessments included the Modified Nail Psoriasis Severity Index (mNAPSI), the Physician’s Global Assessment of Fingernail Psoriasis (PGA-F) and the Nail Psoriasis Severity Index (NAPSI) (see Table 16). Adalimumab demonstrated a treatment benefit in nail psoriasis patients with different extents of skin involvement (BSA≥10% (60% of patients) and BSA<10% and ≥5% (40% of patients)).

a p<0.001, adalimumab vs. placebo

Adalimumab treated patients showed statistically significant improvements at week 26 compared with placebo in the DLQI.

Adolescent hidradenitis suppurativa

There are no clinical trials with adalimumab in adolescent patients with HS. Efficacy of adalimumab for the treatment of adolescent patients with HS is predicted based on the demonstrated efficacy and exposure-response relationship in adult HS patients and the likelihood that the disease course, pathophysiology, and drug effects are substantially similar to that of adults at the same exposure levels. Safety of the recommended adalimumab dose in the adolescent HS population is based on cross-indication safety profile of adalimumab in both adults and paediatric patients at similar or more frequent doses (see section 5.2).

Adult hidradenitis suppurativa

The safety and efficacy of adalimumab were assessed in randomised, double-blind, placebo-controlled studies and an open-label extension study in adult patients with moderate to severe hidradenitis suppurativa (HS) who were intolerant, had a contraindication or an inadequate response to at least a 3-month trial of systemic antibiotic therapy. The patients in HS-I and HS-II had Hurley Stage II or III disease with at least 3 abscesses or inflammatory nodules.

Study HS-I (PIONEER I) evaluated 307 patients with 2 treatment periods. In period A, patients received placebo or adalimumab at an initial dose of 160 mg at week 0, 80 mg at week 2, and 40 mg every week starting at week 4 to week 11. Concomitant antibiotic use was not allowed during the study. After 12 weeks of therapy, patients who had received adalimumab in period A were re-randomised in period B to 1 of 3 treatment groups (adalimumab 40 mg every week, adalimumab 40 mg every other week, or placebo from week 12 to week 35). Patients who had been randomised to placebo in period A were assigned to receive adalimumab 40 mg every week in period B.

Study HS-II (PIONEER II) evaluated 326 patients with 2 treatment periods. In period A, patients received placebo or adalimumab at an initial dose of 160 mg at week 0 and 80 mg at week 2 and 40 mg every week starting at week 4 to week 11. 19.3% of patients had continued baseline oral antibiotic therapy during the study. After 12 weeks of therapy, patients who had received adalimumab in period A were re-randomised in period B to 1 of 3 treatment groups (adalimumab 40 mg every
week, adalimumab 40 mg every other week, or placebo from week 12 to week 35). Patients who had been randomised to placebo in period A were assigned to receive placebo in period B.

Patients participating in Studies HS-I and HS-II were eligible to enrol into an open-label extension study in which adalimumab 40 mg was administered every week. Mean exposure in all adalimumab population was 762 days. Throughout all 3 studies patients used topical antiseptic wash daily.

**Clinical Response**

Reduction of inflammatory lesions and prevention of worsening of abscesses and draining fistulas was assessed using Hidradenitis Suppurativa Clinical Response (HiSCR; at least a 50% reduction in total abscess and inflammatory nodule count with no increase in abscess count and no increase in draining fistula count relative to Baseline). Reduction in HS-related skin pain was assessed using a Numeric Rating Scale in patients who entered the study with an initial baseline score of 3 or greater on a 11 point scale.

At week 12, a significantly higher proportion of patients treated with adalimumab versus placebo achieved HiSCR. At week 12, a significantly higher proportion of patients in Study HS-II experienced a clinically relevant decrease in HS-related skin pain (see Table 17). Patients treated with adalimumab had significantly reduced risk of disease flare during the initial 12 weeks of treatment.

* P < 0.05, ***P < 0.001, adalimumab versus placebo

a Among all randomised patients.

b Among patients with baseline HS-related skin pain assessment ≥ 3, based on Numeric Rating Scale 0 – 10; 0 = no skin pain, 10 = skin pain as bad as you can imagine.

Treatment with adalimumab 40 mg every week significantly reduced the risk of worsening of abscesses and draining fistulas. Approximately twice the proportion of patients in the placebo group in the first 12 weeks of Studies HS-I and HS-II, compared with those in the adalimumab group experienced worsening of abscesses (23.0% vs 11.4%, respectively) and draining fistulas (30.0% vs 13.9%, respectively).

Greater improvements at week 12 from baseline compared to placebo were demonstrated in skin-specific health-related quality of life, as measured by the Dermatology Life Quality Index (DLQI; Studies HS-I and HS-II), patient global satisfaction with medication treatment as measured by the Treatment Satisfaction Questionnaire - medication (TSQM; Studies HS-I and HS-II), and physical health as measured by the physical component summary score of the SF-36 (Study HS-I).

In patients with at least a partial response to adalimumab 40 mg weekly at week 12, the HiSCR rate at week 36 was higher in patients who continued weekly adalimumab than in patients in whom dosing frequency was reduced to every other week, or in whom treatment was withdrawn (see Table 18).

a Patients with at least a partial response to adalimumab 40 mg weekly after 12 weeks of treatment.

b Patients meeting protocol-specified criteria for loss of response or no improvement were required to discontinue from the studies and were counted as nonresponders.

Among patients who were at least partial responders at week 12, and who received continuous weekly adalimumab therapy, the HiSCR rate at week 48 was 68.3% and at week 96 was 65.1%. Longer term treatment with adalimumab 40 mg weekly for 96 weeks identified no new safety findings.

Among patients whose adalimumab treatment was withdrawn at week 12 in Studies HS-I and HS-II, the HiSCR rate 12 weeks after re-introduction of adalimumab 40 mg weekly returned to levels similar to that observed before withdrawal (56.0%).

**Paediatric Crohn's disease**

Adalimumab was assessed in a multicentre, randomised, double-blind clinical trial designed to evaluate the efficacy and safety of induction and maintenance treatment with doses dependent on body weight (< 40 kg or ≥ 40 kg) in 192 paediatric subjects between the ages of 6 and 17 (inclusive) years, with moderate to severe Crohn’s disease (CD) defined as Paediatric Crohn's Disease Activity Index (PCDAI) score > 30. Subjects had to have failed conventional therapy (including a corticosteroid and/or an immunomodulator) for CD. Subjects may also have previously lost response or been intolerant to infliximab.

All subjects received open-label induction therapy at a dose based on their Baseline body weight: 160 mg at week 0 and 80 mg at week 2 for subjects ≥ 40 kg, and 80 mg and 40 mg, respectively, for subjects < 40 kg.

At week 4, subjects were randomised 1:1 based on their body weight at the time to either the Low Dose or Standard Dose maintenance regimens as shown in Table 19.

**Efficacy results**

The primary endpoint of the study was clinical remission at week 26, defined as PCDAI score ≤ 10.

Clinical remission and clinical response (defined as reduction in PCDAI score of at least 15 points from Baseline) rates are presented in Table 20. Rates of discontinuation of corticosteroids or immunomodulators are presented in Table 21.

¹ p value for Standard Dose versus Low Dose comparison.
² Immunosuppressant therapy could only be discontinued at or after week 26 at the investigator's discretion if the subject met the clinical response criterion.
³ defined as a closure of all fistulas that were draining at Baseline for at least 2 consecutive post-Baseline visits.

Statistically significant increases (improvement) from Baseline to week 26 and 52 in Body Mass Index and height velocity were observed for both treatment groups.

Statistically and clinically significant improvements from Baseline were also observed in both treatment groups for quality of life parameters (including IMPACT III).

One hundred patients (n=100) from the Paediatric CD Study continued in an open-label long-term extension study. After 5 years of adalimumab therapy, 74.0% (37/50) of the 50 patients remaining in the study continued to be in clinical remission, and 92.0% (46/50) of patients continued to be in clinical response per PCDAI.

Adult Crohn's disease

The safety and efficacy of adalimumab were assessed in over 1,500 patients with moderately to severely active Crohn's disease (Crohn's Disease Activity Index (CDAI) ≥ 220 and ≤ 450) in randomised, double-blind, placebo-controlled studies. Concomitant stable doses of aminosalicylates, corticosteroids, and/or immunomodulatory agents were permitted and 80% of patients continued to receive at least one of these medications.
Induction of clinical remission (defined as CDAI < 150) was evaluated in two studies, CD Study I (CLASSIC I) and CD Study II (GAIN). In CD Study I, 299 TNF-antagonist naive patients were randomised to one of four treatment groups; placebo at weeks 0 and 2, 160 mg adalimumab at week 0 and 80 mg at week 2, 80 mg at week 0 and 40 mg at week 2, and 40 mg at week 0 and 20 mg at week 2. In CD Study II, 325 patients who had lost response or were intolerant to infliximab were randomised to receive either 160 mg adalimumab at week 0 and 80 mg at week 2 or placebo at weeks 0 and 2. The primary non-responders were excluded from the studies and therefore these patients were not further evaluated.

Maintenance of clinical remission was evaluated in CD Study III (CHARM). In CD Study III, 854 patients received open-label 80 mg at week 0 and 40 mg at week 2. At week 4 patients were randomised to 40 mg every other week, 40 mg every week, or placebo with a total study duration of 56 weeks. Patients in clinical response (decrease in CDAI ≥ 70) at week 4 were stratified and analysed separately from those not in clinical response at week 4. Corticosteroid taper was permitted after week 8.

CD Study I and CD Study II induction of remission and response rates are presented in Table 22.

**p < 0.01

Similar remission rates were observed for the 160/80 mg and 80/40 mg induction regimens by week 8 and adverse events were more frequently noted in the 160/80 mg group.

In CD Study III, at week 4, 58% (499/854) of patients were in clinical response and were assessed in the primary analysis. Of those in clinical response at week 4, 48% had been previously exposed to other TNF-antagonists. Maintenance of remission and response rates are presented in Table 23. Clinical remission results remained relatively constant irrespective of previous TNF-antagonist exposure.

Disease-related hospitalisations and surgeries were statistically significantly reduced with adalimumab compared with placebo at week 56.

* p < 0.001 for adalimumab versus placebo pairwise comparisons of proportions
** p < 0.02 for adalimumab versus placebo pairwise comparisons of proportions
a Of those receiving corticosteroids at baseline

Among patients who were not in response at week 4, 43% of adalimumab maintenance patients responded by week 12 compared to 30% of placebo maintenance patients. These results suggest that some patients who have not responded by week 4 benefit from continued maintenance therapy through week 12. Therapy continued beyond 12 weeks did not result in significantly more responses (see section 4.2).

117/276 patients from CD study I and 272/777 patients from CD studies II and III were followed through at least 3 years of open-label adalimumab therapy. 88 and 189 patients, respectively, continued to be in clinical remission. Clinical response (CR-100) was maintained in 102 and 233 patients, respectively.

**Quality of life**

In CD Study I and CD Study II, statistically significant improvement in the disease-specific inflammatory bowel disease questionnaire (IBDQ) total score was achieved at week 4 in patients randomised to adalimumab 80/40 mg and 160/80 mg compared to placebo and was seen at weeks 26 and 56 in CD Study III as well among the adalimumab treatment groups compared to the placebo group.

**Paediatric Uveitis**

The safety and efficacy of adalimumab was assessed in a randomized, double-masked, controlled study of 90 paediatric patients from 2 to < 18 years of age with active JIA-associated noninfectious anterior uveitis who were refractory to at least 12 weeks of methotrexate treatment. Patients received either placebo or 20 mg adalimumab (if < 30 kg) or 40 mg adalimumab (if ≥ 30 kg) every other week in combination with their baseline dose of methotrexate.

The primary endpoint was ‘time to treatment failure’. The criteria determining treatment failure were worsening or sustained non-improvement in ocular inflammation, partial improvement with development of sustained ocular co-morbidities or worsening of ocular co-morbidities, non-permitted use of concomitant medications, and suspension of treatment for an extended period of time.
**Clinical Response**

Adalimumab significantly delayed the time to treatment failure, as compared to placebo (See Figure 1, \( P < 0.0001 \) from log rank test). The median time to treatment failure was 24.1 weeks for subjects treated with placebo, whereas the median time to treatment failure was not estimable for subjects treated with adalimumab because less than one-half of these subjects experienced treatment failure. Adalimumab significantly decreased the risk of treatment failure by 75% relative to placebo, as shown by the hazard ratio (HR = 0.25 [95% CI: 0.12, 0.49]).

**Figure 1: Kaplan-Meier Curves Summarizing Time to Treatment Failure in the Paediatric Uveitis Study**

![Kaplan-Meier Curves](image_url)

Note: P = Placebo (Number at Risk); H = adalimumab (Number at Risk).

**Adult Uveitis**

The safety and efficacy of adalimumab were assessed in adult patients with non-infectious intermediate, posterior, and panuveitis, excluding patients with isolated anterior uveitis, in two randomised, double-masked, placebo-controlled studies (UV I and II). Patients received placebo or adalimumab at an initial dose of 80 mg followed by 40 mg every other week starting one week after the initial dose. Concomitant stable doses of one non-biologic immunosuppressant were permitted.

Study UV I evaluated 217 patients with active uveitis despite treatment with corticosteroids (oral prednisone at a dose of 10 to 60 mg/day). All patients received a 2-week standardised dose of prednisone 60 mg/day at study entry followed by a mandatory taper schedule, with complete corticosteroid discontinuation by week 15.
Study UV II evaluated 226 patients with inactive uveitis requiring chronic corticosteroid treatment (oral prednisone 10 to 35 mg/day) at baseline to control their disease. Patients subsequently underwent a mandatory taper schedule, with complete corticosteroid discontinuation by week 19.

The primary efficacy endpoint in both studies was ‘time to treatment failure’. Treatment failure was defined by a multi-component outcome based on inflammatory chorioretinal and/or inflammatory retinal vascular lesions, anterior chamber (AC) cell grade, vitreous haze (VH) grade and best corrected visual acuity (BCVA).

**Clinical Response**

Results from both studies demonstrated statistically significant reduction of the risk of treatment failure in patients treated with adalimumab versus patients receiving placebo (See Table 24). Both studies demonstrated an early and sustained effect of adalimumab on the treatment failure rate versus placebo (see Figure 2).

Note: Treatment failure at or after week 6 (Study UV I), or at or after week 2 (Study UV II), was counted as event. Drop outs due to reasons other than treatment failure were censored at the time of dropping out.

a HR of adalimumab vs placebo from proportional hazards regression with treatment as factor.
b 2-sided P value from log rank test.
c NE = not estimable. Fewer than half of at-risk subjects had an event.

Figure 2: Kaplan-Meier Curves Summarizing Time to Treatment Failure on or after week 6 (Study UV I) or week 2 (Study UV II)
In Study UV I statistically significant differences in favour of adalimumab versus placebo were observed for each component of treatment failure. In Study UV II, statistically significant differences were observed for visual acuity only, but the other components were numerically in favour of adalimumab.

Of the 417 subjects included in the uncontrolled long-term extension of Studies UV I and UV II, 46 subjects were regarded ineligible (e.g. developed complications secondary to diabetic retinopathy, due to cataract surgery or vitrectomy) and were excluded from the primary analysis of efficacy. Of the 371 remaining patients, 276 evaluable patients reached 78 weeks of open-label adalimumab treatment. Based on the observed data approach, 222 (80.4%) were in quiescence (no active inflammatory lesions, AC cell grade ≤ 0.5+, VH grade ≤ 0.5+) with a concomitant steroid dose ≤ 7.5 mg per day, and 184 (66.7 %) were in steroid-free quiescence. BCVA was either improved or maintained (< 5 letters deterioration) in 88.4% of the eyes at week 78. Among the patients who discontinued the study prior to week 78, 11% discontinued due to adverse events, and 5% due to insufficient response to adalimumab treatment.

**Quality of Life**

Patient reported outcomes regarding vision-related functioning were measured in both clinical studies, using the NEI VFQ-25. Adalimumab was numerically favoured for the majority of subscores with statistically significant mean differences for general vision, ocular pain, near vision, mental health, and total score in Study UV I, and for general vision and mental health in Study UV II. Vision related effects were not numerically in favour of adalimumab for colour vision in Study UVI and for colour vision, peripheral vision and near vision in Study UV II.

**Immunogenicity**

Anti-adalimumab antibodies may develop during adalimumab treatment. Formation of anti-adalimumab antibodies is associated with increased clearance and reduced efficacy of adalimumab. There is no apparent correlation between the presence of anti-adalimumab antibodies and the occurrence of adverse events.
Paediatric population

The European Medicines Agency has deferred the obligation to submit the results of the studies with the reference medicinal product containing adalimumab in one or more subsets of the paediatric population in ulcerative colitis, see section 4.2 for information on paediatric use.

5.2 Pharmacokinetic properties

Absorption and distribution

Following the administration of 24 mg/m² (up to a maximum of 40 mg) subcutaneously every other week to patients with polyarticular juvenile idiopathic arthritis (JIA) who were 4 to 17 years the mean trough steady-state (values measured from week 20 to 48) serum adalimumab concentration was 5.6 ± 5.6 µg/ml (102% CV) for adalimumab without concomitant methotrexate and 10.9 ± 5.2 µg/ml (47.7% CV) with concomitant methotrexate.

In patients with polyarticular JIA who were 2 to <4 years old or aged 4 and above weighing <15 kg dosed with adalimumab 24 mg/m², the mean trough steady-state serum adalimumab concentrations was 6.0 ± 6.1 µg/ml (101% CV) for adalimumab without concomitant methotrexate and 7.9 ± 5.6 µg/ml (71.2% CV) with concomitant methotrexate.

Following the administration of 24 mg/m² (up to a maximum of 40 mg) subcutaneously every other week to patients with enthesitis-related arthritis who were 6 to 17 years, the mean trough steady-state (values measured at week 24) serum adalimumab concentrations were 8.8 ± 6.6 µg/ml for adalimumab without concomitant methotrexate and 11.8 ± 4.3 µg/ml with concomitant methotrexate.

Following the administration of 0.8 mg/kg (up to a maximum of 40 mg) subcutaneously every other week to paediatric patients with chronic plaque psoriasis, the mean ± SD steady-state adalimumab trough concentration was approximately 7.4 ± 5.8 µg/ml (79% CV).

Adalimumab exposure in adolescent HS patients was predicted using population pharmacokinetic modelling and simulation based on cross-indication pharmacokinetics in other paediatric patients (paediatric psoriasis, juvenile idiopathic arthritis, paediatric Crohn’s disease, and enthesitis-related arthritis). The recommended adolescent HS dosing schedule is 40 mg every other week. Since exposure to adalimumab can be affected by body size, adolescents with higher body weight and inadequate response may benefit from receiving the recommended adult dose of 40 mg every week.

In paediatric patients with moderate to severe CD, the open-label adalimumab induction dose was 160/80 mg or 80/40 mg at weeks 0 and 2, respectively, dependent on a body weight cut-off of 40 kg. At week 4, patients were randomised 1:1 to either the Standard Dose (40/20 mg eow) or Low Dose (20/10 mg eow) maintenance treatment groups based on their body weight. The mean (±SD) serum adalimumab trough concentrations achieved at week 4 were 15.7 ± 6.6 µg/ml for patients ≥ 40 kg (160/80 mg) and 10.6 ± 6.1 µg/ml for patients < 40 kg (80/40 mg).

For patients who stayed on their randomised therapy, the mean (±SD) adalimumab trough concentrations at week 52 were 9.5 ± 5.6 µg/ml for the Standard Dose group and 3.5 ± 2.2 µg/ml for the Low Dose group. The mean trough concentrations were maintained in patients who continued to receive adalimumab treatment eow for 52 weeks. For patients who dose escalated from eow to weekly regimen, the mean (±SD) serum concentrations of adalimumab at week 52 were 15.3 ± 11.4 µg/ml (40/20 mg, weekly) and 6.7 ± 3.5 µg/ml (20/10 mg, weekly).

Adalimumab exposure in paediatric uveitis patients was predicted using population pharmacokinetic modelling and simulation based on cross-indication pharmacokinetics in other paediatric patients (paediatric psoriasis, juvenile idiopathic arthritis, paediatric Crohn’s disease, and enthesitis-related arthritis). No clinical exposure data are available on the use of a loading dose in children < 6 years. The predicted exposures indicate that in the absence of methotrexate, a loading dose may lead to an initial increase in systemic exposure.
Exposure-response relationship in paediatric population

On the basis of clinical trial data in patients with JIA (pJIA and ERA), an exposure-response relationship was established between plasma concentrations and PedACR 50 response. The apparent adalimumab plasma concentration that produces half the maximum probability of PedACR 50 response (EC50) was 3 μg/ml (95% CI: 1.6-6 μg/ml).

Exposure-response relationships between adalimumab concentration and efficacy in paediatric patients with severe chronic plaque psoriasis were established for PASI 75 and PGA clear or minimal, respectively. PASI 75 and PGA clear or minimal increased with increasing adalimumab concentrations, both with a similar apparent EC50 of approximately 4.5 μg/ml (95% CI 0.4-47.6 and 1.9-10.5, respectively).

Adults

After subcutaneous administration of a single 40 mg dose, absorption and distribution of adalimumab was slow, with peak serum concentrations being reached about 5 days after administration. The average absolute bioavailability of adalimumab estimated from three studies following a single 40 mg subcutaneous dose was 64%. After single intravenous doses ranging from 0.25 to 10 mg/kg, concentrations were dose proportional. After doses of 0.5 mg/kg (~40 mg), clearances ranged from 11 to 15 ml/hour, the distribution volume (Vss) ranged from 5 to 6 litres and the mean terminal phase half-life was approximately two weeks. Adalimumab concentrations in the synovial fluid from several rheumatoid arthritis patients ranged from 31-96% of those in serum.

Following subcutaneous administration of 40 mg of adalimumab every other week in adult rheumatoid arthritis (RA) patients the mean steady-state trough concentrations were approximately 5 μg/ml (without concomitant methotrexate) and 8 to 9 μg/ml (with concomitant methotrexate), respectively. The serum adalimumab trough levels at steady-state increased roughly proportionally with dose following 20, 40 and 80 mg subcutaneous dosing every other week and every week.

In adult patients with psoriasis, the mean steady-state trough concentration was 5 μg/ml during adalimumab 40 mg every other week monotherapy treatment.

In adult patients with hidradenitis suppurativa, a dose of 160 mg adalimumab on week 0 followed by 80 mg on week 2 achieved serum adalimumab trough concentrations of approximately 7 to 8 μg/ml at week 2 and week 4. The mean steady-state trough concentration at week 12 through week 36 were approximately 8 to 10 μg/ml during adalimumab 40 mg every week treatment.

In patients with Crohn’s disease, the loading dose of 80 mg adalimumab on week 0 followed by 40 mg adalimumab on week 2 achieves serum adalimumab trough concentrations of approximately 5.5 μg/ml during the induction period. A loading dose of 160 mg adalimumab on week 0 followed by 80 mg adalimumab on week 2 achieves serum adalimumab trough concentrations of approximately 12 μg/ml during the induction period. Mean steady-state trough levels of approximately 7 μg/ml were observed in Crohn’s disease patients who received a maintenance dose of 40 mg adalimumab every other week.

In adult patients with uveitis, a loading dose of 80 mg adalimumab on week 0 followed by 40 mg adalimumab every other week starting at week 1, resulted in mean steady-state concentrations of approximately 8 to 10 μg/ml.

Population pharmacokinetic and pharmacokinetic/pharmacodynamic modelling and simulation predicted comparable adalimumab exposure and efficacy in patients treated with 80 mg every other week when compared with 40 mg every week (including adult patients with RA, HS, UC, CD or Ps, patients with adolescent HS, and paediatric patients ≥ 40 kg with CD).
Elimination

Population pharmacokinetic analyses with data from over 1,300 RA patients revealed a trend toward higher apparent clearance of adalimumab with increasing body weight. After adjustment for weight differences, gender and age appeared to have a minimal effect on adalimumab clearance. The serum levels of free adalimumab (not bound to anti-adalimumab antibodies, AAA) were observed to be lower in patients with measurable AAA.

Hepatic or renal impairment

Adalimumab has not been studied in patients with hepatic or renal impairment.

5.3 Preclinical safety data

Non-clinical data reveal no special hazard for humans based on studies of single dose toxicity, repeated dose toxicity, and genotoxicity.

An embryo-foetal developmental toxicity/perinatal developmental study has been performed in cynomolgus monkeys at 0, 30 and 100 mg/kg (9-17 monkeys/group) and has revealed no evidence of harm to the foetuses due to adalimumab. Neither carcinogenicity studies, nor a standard assessment of fertility and postnatal toxicity, were performed with adalimumab due to the lack of appropriate models for an antibody with limited cross-reactivity to rodent TNF and to the development of neutralising antibodies in rodents.

Monosodium glutamate
Sorbitol (E420)
Methionine
Polysorbate 80
Hydrochloric acid (for pH-adjustment)
Water for injections

6.2 Incompatibilities

In the absence of compatibility studies, this medicinal product must not be mixed with other medicinal products.

6.3 Shelf life

2 years

6.4 Special precautions for storage

Store in a refrigerator (2°C – 8°C). Do not freeze. Keep the vial in the outer carton in order to protect from light.

6.5 Nature and contents of container

Hulio 40 mg solution for injection in single-use vial (type I glass), fitted with rubber stoppers (fluoropolymer-laminated butyl rubber), aluminium crimps and flip-off seals.

A multipack of 2 single packs. Each single pack containing 1 vial (0.8 ml sterile solution), 1 empty sterile injection syringe, 1 sterile needle, 1 sterile vial adapter and 2 alcohol pads.
Not all pack sizes may be marketed.

6.6 Special precautions for disposal

Any unused medicinal product or waste material should be disposed of in accordance with local requirements.

7. MARKETING AUTHORISATION HOLDER

Mylan S.A.S.
117 allée des Parcs
69800 Saint-Priest
France

8. MARKETING AUTHORISATION NUMBER(S)

EU/1/18/1319/007

9. DATE OF FIRST AUTHORISATION/RENEWAL OF THE AUTHORISATION

Date of first authorisation:

10. DATE OF REVISION OF THE TEXT

This medicinal product is subject to additional monitoring. This will allow quick identification of new safety information. Healthcare professionals are asked to report any suspected adverse reactions. See section 4.8 for how to report adverse reactions.

1. **NAME OF THE MEDICINAL PRODUCT**

Hulio 40 mg solution for injection in pre-filled syringe
Hulio 40 mg solution for injection in pre-filled pen

2. **QUALITATIVE AND QUANTITATIVE COMPOSITION**

Hulio 40 mg solution for injection in pre-filled syringe
Each 0.8 ml single dose pre-filled syringe contains 40 mg of adalimumab.

Hulio 40 mg solution for injection in pre-filled pen
Each 0.8 ml single dose pre-filled pen contains 40 mg of adalimumab.

Adalimumab is a recombinant human monoclonal antibody produced in Chinese Hamster Ovary cells.

**Excipient with known effect:**
Each pre-filled syringe or pre-filled pen contains 38.2 mg sorbitol (E420).

For the full list of excipients, see section 6.1.

3. **PHARMACEUTICAL FORM**

Solution for injection (injection).

Clear or slightly opalescent, colourless to pale brownish-yellow solution.

4. **CLINICAL PARTICULARS**

4.1 **Therapeutic indications**

Rheumatoid arthritis

Hulio in combination with methotrexate, is indicated for:

- the treatment of moderate to severe, active rheumatoid arthritis in adult patients when the response to disease-modifying anti-rheumatic drugs including methotrexate has been inadequate.
- the treatment of severe, active and progressive rheumatoid arthritis in adults not previously treated with methotrexate.

Hulio can be given as monotherapy in case of intolerance to methotrexate or when continued treatment with methotrexate is inappropriate.

Adalimumab has been shown to reduce the rate of progression of joint damage as measured by X-ray and to improve physical function, when given in combination with methotrexate.
Juvenile idiopathic arthritis

Polyarticular juvenile idiopathic arthritis

Hulio in combination with methotrexate is indicated for the treatment of active polyarticular juvenile idiopathic arthritis, in patients from the age of 2 years who have had an inadequate response to one or more disease-modifying anti-rheumatic drugs (DMARDs). Hulio can be given as monotherapy in case of intolerance to methotrexate or when continued treatment with methotrexate is inappropriate (for the efficacy in monotherapy see section 5.1). Adalimumab has not been studied in patients aged less than 2 years.

Enthesitis-related arthritis

Hulio is indicated for the treatment of active enthesitis-related arthritis in patients, 6 years of age and older, who have had an inadequate response to, or who are intolerant of, conventional therapy (see section 5.1).

Axial spondyloarthritis

Ankylosing spondylitis (AS)

Hulio is indicated for the treatment of adults with severe active ankylosing spondylitis who have had an inadequate response to conventional therapy.

Axial spondyloarthritis without radiographic evidence of AS

Hulio is indicated for the treatment of adults with severe axial spondyloarthritis without radiographic evidence of AS but with objective signs of inflammation by elevated CRP and/or MRI, who have had an inadequate response to, or are intolerant to nonsteroidal anti-inflammatory drugs.

Psoriatic arthritis

Hulio is indicated for the treatment of active and progressive psoriatic arthritis in adults when the response to previous disease-modifying anti-rheumatic drug therapy has been inadequate. Adalimumab has been shown to reduce the rate of progression of peripheral joint damage as measured by X-ray in patients with polyarticular symmetrical subtypes of the disease (see Section 5.1) and to improve physical function.

Psoriasis

Hulio is indicated for the treatment of moderate to severe chronic plaque psoriasis in adult patients who are candidates for systemic therapy.

Paediatric plaque psoriasis

Hulio is indicated for the treatment of severe chronic plaque psoriasis in children and adolescents from 4 years of age who have had an inadequate response to or are inappropriate candidates for topical therapy and phototherapies.

Hidradenitis suppurativa (HS)

Hulio is indicated for the treatment of active moderate to severe hidradenitis suppurativa (acne inversa) in adults and adolescents from 12 years of age with an inadequate response to conventional systemic HS therapy (see sections 5.1 and 5.2).
Crohn’s disease

Hulio is indicated for treatment of moderately to severely active Crohn’s disease, in adult patients who have not responded despite a full and adequate course of therapy with a corticosteroid and/or an immunosuppressant; or who are intolerant to or have medical contraindications for such therapies.

Paediatric Crohn's disease

Hulio is indicated for the treatment of moderately to severely active Crohn's disease in paediatric patients (from 6 years of age) who have had an inadequate response to conventional therapy including primary nutrition therapy and a corticosteroid and/or an immunomodulator, or who are intolerant to or have contraindications for such therapies.

Ulcerative colitis

Hulio is indicated for the treatment of moderately to severely active ulcerative colitis in adult patients who have had an inadequate response to conventional therapy including corticosteroids and 6-mercaptopurine (6-MP) or azathioprine (AZA), or who are intolerant to or have medical contraindications for such therapies.

Uveitis

Hulio is indicated for the treatment of non-infectious intermediate, posterior and panuveitis in adult patients who have had an inadequate response to corticosteroids, in patients in need of corticosteroid sparing, or in whom corticosteroid treatment is inappropriate.

Paediatric Uveitis

Hulio is indicated for the treatment of paediatric chronic non-infectious anterior uveitis in patients from 2 years of age who have had an inadequate response to or are intolerant to conventional therapy, or in whom conventional therapy is inappropriate.

4.2 Posology and method of administration

Hulio treatment should be initiated and supervised by specialist physicians experienced in the diagnosis and treatment of conditions for which Hulio is indicated. Ophthalmologists are advised to consult with an appropriate specialist before initiation of treatment with Hulio (see section 4.4). Patients treated with Hulio should be given the patient alert card.

After proper training in injection technique, patients may self-inject with Hulio if their physician determines that it is appropriate and with medical follow-up as necessary.

During treatment with Hulio, other concomitant therapies (e.g., corticosteroids and/or immunomodulatory agents) should be optimised.

Posology

Rheumatoid arthritis

The recommended dose of Hulio for adult patients with rheumatoid arthritis is 40 mg adalimumab administered every other week as a single dose via subcutaneous injection. Methotrexate should be continued during treatment with Hulio.

Glucocorticoids, salicylates, nonsteroidal anti-inflammatory drugs, or analgesics can be continued during treatment with Hulio. Regarding combination with disease modifying anti-rheumatic drugs other than methotrexate see sections 4.4 and 5.1.
In monotherapy, some patients who experience a decrease in their response to Hulio 40 mg every other week may benefit from an increase in dosage to 40 mg adalimumab every week or 80 mg every other week.

Available data suggest that the clinical response is usually achieved within 12 weeks of treatment. Continued therapy should be reconsidered in a patient not responding within this time period.

Hulio may be available in other presentations depending on the individual treatment needs.

Dose interruption

There may be a need for dose interruption, for instance before surgery or if a serious infection occurs.

Available data suggest that re-introduction of adalimumab after discontinuation for 70 days or longer resulted in the same magnitudes of clinical response and similar safety profile as before dose interruption.

Ankylosing spondylitis, axial spondyloarthritis without radiographic evidence of AS and psoriatic arthritis

The recommended dose of Hulio for patients with ankylosing spondylitis axial spondyloarthritis without radiographic evidence of AS and for patients with psoriatic arthritis is 40 mg adalimumab administered every other week as a single dose via subcutaneous injection.

Available data suggest that the clinical response is usually achieved within 12 weeks of treatment. Continued therapy should be reconsidered in a patient not responding within this time period.

Psoriasis

The recommended dose of Hulio for adult patients is an initial dose of 80 mg administered subcutaneously, followed by 40 mg subcutaneously given every other week starting one week after the initial dose.

Continued therapy beyond 16 weeks should be carefully reconsidered in a patient not responding within this time period.

Beyond 16 weeks, patients with inadequate response to Hulio 40 mg every other week may benefit from an increase in dosage to 40 mg every week or 80 mg every other week. The benefits and risks of continued 40 mg weekly or 80 mg every other week therapy should be carefully reconsidered in a patient with an inadequate response after the increase in dosage (see section 5.1). If adequate response is achieved with 40 mg every week or 80 mg every other week, the dosage may subsequently be reduced to 40 mg every other week.

Hulio may be available in other presentations depending on the individual treatment needs.

Hidradenitis suppurativa

The recommended Hulio dose regimen for adult patients with hidradenitis suppurativa (HS) is 160 mg initially at Day 1 (given as four 40 mg injections in one day or as two 40 mg injections per day for two consecutive days), followed by 80 mg two weeks later at Day 15 (given as two 40 mg injections in one day). Two weeks later (Day 29) continue with a dose of 40 mg every week or 80 mg every other week (given as two 40 mg injections in one day). Antibiotics may be continued during treatment with Hulio if necessary. It is recommended that the patient should use a topical antiseptic wash on their HS lesions on a daily basis during treatment with Hulio.
Continued therapy beyond 12 weeks should be carefully reconsidered in a patient with no improvement within this time period.

Should treatment be interrupted, Hulio 40 mg every week or 80 mg every other week may be re-introduced (see section 5.1).

The benefit and risk of continued long-term treatment should be periodically evaluated (see section 5.1).

Hulio may be available in other presentations depending on the individual treatment needs.

**Crohn’s disease**

The recommended Hulio induction dose regimen for adult patients with moderately to severely active Crohn’s disease is 80 mg at week 0 followed by 40 mg at week 2. In case there is a need for a more rapid response to therapy, the regimen 160 mg at week 0 (given as four 40 mg injections in one day or as two injections per day for two consecutive days), 80 mg at week 2 (given as two 40 mg injections in one day), can be used with the awareness that the risk for adverse events is higher during induction.

After induction treatment, the recommended dose is 40 mg every other week via subcutaneous injection. Alternatively, if a patient has stopped Hulio and signs and symptoms of disease recur, Hulio may be re-administered. There is little experience from re-administration after more than 8 weeks since the previous dose.

During maintenance treatment, corticosteroids may be tapered in accordance with clinical practice guidelines.

Some patients who experience decrease in their response to Hulio 40 mg every other week may benefit from an increase in dosage to 40 mg Hulio every week or 80 mg every other week.

Some patients who have not responded by week 4 may benefit from continued maintenance therapy through week 12. Continued therapy should be carefully reconsidered in a patient not responding within this time period.

Hulio may be available in other presentations depending on the individual treatment needs.

**Ulcerative colitis**

The recommended Hulio induction dose regimen for adult patients with moderate to severe ulcerative colitis is 160 mg at week 0 (given as four 40 mg injections in one day or as two 40 mg injections per day for two consecutive days) and 80 mg at week 2 (given as two 40 mg injections in one day). After induction treatment, the recommended dose is 40 mg every other week via subcutaneous injection.

During maintenance treatment, corticosteroids may be tapered in accordance with clinical practice guidelines.

Some patients who experience decrease in their response to Hulio 40 mg every other week may benefit from an increase in dosage to 40 mg Hulio every week or 80 mg every other week.

Available data suggest that clinical response is usually achieved within 2-8 weeks of treatment. Hulio therapy should not be continued in patients failing to respond within this time period.

Hulio may be available in other presentations depending on the individual treatment needs.
Uveitis

The recommended dose of Hulio for adult patients with uveitis is an initial dose of 80 mg, followed by 40 mg given every other week starting one week after the initial dose. There is limited experience in the initiation of treatment with adalimumab alone. Treatment with Hulio can be initiated in combination with corticosteroids and/or with other non-biologic immunomodulatory agents. Concomitant corticosteroids may be tapered in accordance with clinical practice starting two weeks after initiating treatment with Hulio.

It is recommended that the benefit and risk of continued long-term treatment should be evaluated on a yearly basis (see section 5.1).

Hulio may be available in other presentations depending on the individual treatment needs.

Special populations

Elderly

No dose adjustment is required.

Renal and/or hepatic impairment

Adalimumab has not been studied in these patient populations. No dose recommendations can be made.

Paediatric population

Juvenile idiopathic arthritis

Polyarticular juvenile idiopathic arthritis from 2 years of age

The recommended dose of Hulio for patients with polyarticular juvenile idiopathic arthritis, aged from 2 years of age is based on body weight (Table 1). Hulio is administered every other week via subcutaneous injection.

Table 1: Hulio Dose for Patients with Polyarticular Juvenile Idiopathic Arthritis

<table>
<thead>
<tr>

</thead>
<tbody>
<tr>
<td>10 kg to &lt; 30 kg</td>
<td>20 mg every other week</td>
</tr>
<tr>
<td>≥ 30 kg</td>
<td>40 mg every other week</td>
</tr>
</tbody>
</table>

Available data suggest that clinical response is usually achieved within 12 weeks of treatment. Continued therapy should be carefully reconsidered in a patient not responding within this time period.

There is no relevant use of adalimumab in patients aged less than 2 years for this indication.

Hulio may be available in other presentations depending on the individual treatment needs.

Enthesitis-related arthritis

The recommended dose of Hulio for patients with enthesitis-related arthritis from 6 years of age is based on body weight (Table 2). Hulio is administered every other week via subcutaneous injection.
Table 2:  Hulio Dose for Patients with Enthesitis-Related Arthritis

</tr>
</tbody>
</table>

Adalimumab has not been studied in patients with enthesitis-related arthritis aged less than 6 years.

Hulio may be available in other presentations depending on the individual treatment needs.

**Paediatric plaque psoriasis**

The recommended Hulio dose for patients with plaque psoriasis from 4 to 17 years of age is based on body weight (Table 3). Hulio is administered via subcutaneous injection.

Table 3:  Hulio Dose for Paediatric Patients with Plaque Psoriasis

</tr>
<tr>
<td>≥ 30 kg</td>
<td>Initial dose of 40 mg, followed by 40 mg given every other week starting one week after the initial dose</td>
</tr>
</tbody>
</table>

Continued therapy beyond 16 weeks should be carefully considered in a patient not responding within this time period.

If retreatment with Hulio is indicated, the above guidance on dose and treatment duration should be followed.

The safety of adalimumab in paediatric patients with plaque psoriasis has been assessed for a mean of 13 months.

There is no relevant use of adalimumab in children aged less than 4 years for this indication.

Hulio may be available in other presentations depending on the individual treatment needs.

**Adolescent hidradenitis suppurativa (from 12 years of age, weighing at least 30 kg)**

There are no clinical trials with adalimumab in adolescent patients with HS. The posology of adalimumab in these patients has been determined from pharmacokinetic modelling and simulation (see section 5.2).

The recommended Hulio dose is 80 mg at week 0 followed by 40 mg every other week starting at week 1 via subcutaneous injection.

In adolescent patients with inadequate response to Hulio 40 mg every other week, an increase in dosage to 40 mg every week or 80 mg every other week may be considered.
Antibiotics may be continued during treatment with Hulio if necessary. It is recommended that the patient should use a topical antiseptic wash on their HS lesions on a daily basis during treatment with Hulio.

Continued therapy beyond 12 weeks should be carefully reconsidered in a patient with no improvement within this time period.

Should treatment be interrupted, Hulio may be re-introduced as appropriate.

The benefit and risk of continued long-term treatment should be periodically evaluated (see adult data in section 5.1)

There is no relevant use of adalimumab in children aged less than 6 years for this indication.

Hulio may be available in other presentations depending on the individual treatment needs.

**Paediatric Crohn's disease**

The recommended dose of Hulio for patients with Crohn’s disease from 6 to 17 years of age is based on body weight (Table 4). Hulio is administered via subcutaneous injection.

**Table 4: Hulio Dose for Paediatric Patients with Crohn’s disease**

<table>

</table>

Patients who experience insufficient response may benefit from an increase in dosage:
• < 40 kg: 20 mg every week
• ≥ 40 kg: 40 mg every week or 80 mg every other week.

Continued therapy should be carefully considered in a subject not responding by week 12.

There is no relevant use of adalimumab in children aged less than 12 years in this indication.

Hulio may be available in other presentations depending on the individual treatment needs.

**Paediatric Uveitis**

The recommended dose of Hulio for paediatric patients with uveitis from 2 years of age is based on body weight (Table 5). Hulio is administered via subcutaneous injection.
In paediatric uveitis, there is no experience in the treatment with Hulio without concomitant treatment with methotrexate.

Table 5: Hulio Dose for Paediatric Patients with Uveitis

<table>
<thead>
<tr>
<th>Patient Weight</th>

</tr>
</tbody>
</table>

When Hulio therapy is initiated, a loading dose of 40 mg for patients < 30 kg or 80 mg for patients ≥ 30 kg may be administered one week prior to the start of maintenance therapy. No clinical data are available on the use of a Hulio loading dose in children < 6 years of age (see section 5.2).

There is no relevant use of adalimumab in children aged less than 2 years in this indication.

It is recommended that the benefit and risk of continued long-term treatment should be evaluated on a yearly basis (see section 5.1).

Hulio may be available in other presentations depending on the individual treatment needs.

*Paediatric ulcerative colitis*

The safety and efficacy of adalimumab in children aged 4-17 years have not yet been established. No data are available. There is no relevant use of adalimumab in children aged less than 4 years for this indication.

*Psoriatic arthritis and axial spondyloarthritis including ankylosing spondylitis*

There is no relevant use of adalimumab in the paediatric population for the indications of ankylosing spondylitis and psoriatic arthritis.

*Method of administration*

Hulio is administered by subcutaneous injection. Full instructions for use are provided in the package leaflet.

A 40 mg paediatric vial is available for patients who need to administer less than the full 40 mg dose.

### 4.3 Contraindications

Hypersensitivity to the active substance or to any of the excipients listed in section 6.1.

Active tuberculosis or other severe infections such as sepsis, and opportunistic infections (see section 4.4).

Moderate to severe heart failure (NYHA class III/IV) (see section 4.4).

### 4.4 Special warnings and precautions for use

*Traceability*

In order to improve traceability of biological medicinal products, the name and the batch number of the administered product should be clearly recorded.
Infections

Patients taking TNF-antagonists are more susceptible to serious infections. Impaired lung function may increase the risk for developing infections. Patients must therefore be monitored closely for infections, including tuberculosis, before, during and after treatment with Hulio. Because the elimination of adalimumab may take up to four months, monitoring should be continued throughout this period.

Treatment with Hulio should not be initiated in patients with active infections including chronic or localised infections until infections are controlled. In patients who have been exposed to tuberculosis and patients who have travelled in areas of high risk of tuberculosis or endemic mycoses, such as histoplasmosis, coccidioidomycosis, or blastomycosis, the risk and benefits of treatment with Hulio should be considered prior to initiating therapy (see Other opportunistic infections).

Patients who develop a new infection while undergoing treatment with Hulio, should be monitored closely and undergo a complete diagnostic evaluation. Administration of Hulio should be discontinued if a patient develops a new serious infection or sepsis, and appropriate antimicrobial or antifungal therapy should be initiated until the infection is controlled. Physicians should exercise caution when considering the use of Hulio in patients with a history of recurring infection or with underlying conditions which may predispose patients to infections, including the use of concomitant immunosuppressive medications.

Serious infections

Serious infections, including sepsis, due to bacterial, mycobacterial, invasive fungal, parasitic, viral, or other opportunistic infections such as listeriosis, legionellosis and pneumocystis have been reported in patients receiving adalimumab.

Other serious infections seen in clinical trials include pneumonia, pyelonephritis, septic arthritis and septicaemia. Hospitalisation or fatal outcomes associated with infections have been reported.

Tuberculosis

Tuberculosis, including reactivation and new onset of tuberculosis, has been reported in patients receiving adalimumab. Reports included cases of pulmonary and extra-pulmonary (i.e. disseminated) tuberculosis.

Before initiation of therapy with Hulio, all patients must be evaluated for both active or inactive (“latent”) tuberculosis infection. This evaluation should include a detailed medical assessment of patient history of tuberculosis or possible previous exposure to people with active tuberculosis and previous and/or current immunosuppressive therapy. Appropriate screening tests (i.e. tuberculin skin test and chest X-ray) should be performed in all patients (local recommendations may apply). It is recommended that the conduct and results of these tests are recorded in the patient alert card. Prescribers are reminded of the risk of false negative tuberculin skin test results, especially in patients who are severely ill or immunocompromised.

If active tuberculosis is diagnosed, Hulio therapy must not be initiated (see section 4.3).

In all situations described below, the benefit/risk balance of therapy should be very carefully considered.

If latent tuberculosis is suspected, a physician with expertise in the treatment of tuberculosis should be consulted.

If latent tuberculosis is diagnosed, appropriate treatment must be started with anti-tuberculosis prophylaxis treatment before the initiation of Hulio, and in accordance with local recommendations.
Use of anti-tuberculosis prophylaxis treatment should also be considered before the initiation of Hulio in patients with several or significant risk factors for tuberculosis despite a negative test for tuberculosis and in patients with a past history of latent or active tuberculosis in whom an adequate course of treatment cannot be confirmed.

Despite prophylactic treatment for tuberculosis, cases of reactivated tuberculosis have occurred in patients treated with adalimumab. Some patients who have been successfully treated for active tuberculosis have redeveloped tuberculosis while being treated with adalimumab.

Patients should be instructed to seek medical advice if signs/symptoms suggestive of a tuberculosis infection (e.g., persistent cough, wasting/weight loss, low grade fever, listlessness) occur during or after therapy with Hulio.

**Other opportunistic infections**

Opportunistic infections, including invasive fungal infections have been observed in patients receiving adalimumab. These infections have not consistently been recognised in patients taking TNF-antagonists and this has resulted in delays in appropriate treatment, sometimes resulting in fatal outcomes.

For patients who develop the signs and symptoms such as fever, malaise, weight loss, sweats, cough, dyspnoea, and/or pulmonary infiltrates or other serious systemic illness with or without concomitant shock an invasive fungal infection should be suspected and administration of Hulio should be promptly discontinued. Diagnosis and administration of empiric antifungal therapy in these patients should be made in consultation with a physician with expertise in the care of patients with invasive fungal infections.

**Hepatitis B reactivation**

Reactivation of hepatitis B has occurred in patients receiving a TNF-antagonist including adalimumab, who are chronic carriers of this virus (i.e. surface antigen positive). Some cases have had a fatal outcome. Patients should be tested for HBV infection before initiating treatment with Hulio. For patients who test positive for hepatitis B infection, consultation with a physician with expertise in the treatment of hepatitis B is recommended.

Carriers of HBV who require treatment with Hulio should be closely monitored for signs and symptoms of active HBV infection throughout therapy and for several months following termination of therapy. Adequate data from treating patients who are carriers of HBV with anti-viral therapy in conjunction with TNF-antagonist therapy to prevent HBV reactivation are not available. In patients who develop HBV reactivation, Hulio should be stopped and effective anti-viral therapy with appropriate supportive treatment should be initiated.

**Neurological events**

TNF-antagonists including adalimumab have been associated in rare instances with new onset or exacerbation of clinical symptoms and/or radiographic evidence of central nervous system demyelinating disease including multiple sclerosis and optic neuritis, and peripheral demyelinating disease, including Guillain-Barré syndrome. Prescribers should exercise caution in considering the use of Hulio in patients with pre-existing or recent-onset central or peripheral nervous system demyelinating disorders; discontinuation of Hulio should be considered if any of these disorders develop. There is a known association between intermediate uveitis and central demyelinating disorders. Neurologic evaluation should be performed in patients with non-infectious intermediate uveitis prior to the initiation of Hulio therapy and regularly during treatment to assess for pre-existing or developing central demyelinating disorders.
Allergic reactions

Serious allergic reactions associated with adalimumab were rare during clinical trials. Non-serious allergic reactions associated with adalimumab were uncommon during clinical trials. Reports of serious allergic reactions including anaphylaxis have been received following adalimumab administration. If an anaphylactic reaction or other serious allergic reaction occurs, administration of Hulio should be discontinued immediately and appropriate therapy initiated.

Immunosuppression

In a study of 64 patients with rheumatoid arthritis that were treated with adalimumab, there was no evidence of depression of delayed-type hypersensitivity, depression of immunoglobulin levels, or change in enumeration of effector T-, B-, NK-cells, monocyte/macrophages, and neutrophils.

Malignancies and lymphoproliferative disorders

In the controlled portions of clinical trials of TNF-antagonists, more cases of malignancies including lymphoma have been observed among patients receiving a TNF-antagonist compared with control patients. However, the occurrence was rare. In the post marketing setting, cases of leukaemia have been reported in patients treated with a TNF-antagonist. There is an increased background risk for lymphoma and leukaemia in rheumatoid arthritis patients with long-standing highly active, inflammatory disease, which complicates the risk estimation. With the current knowledge, a possible risk for the development of lymphomas, leukaemia, and other malignancies in patients treated with a TNF-antagonist cannot be excluded.

Malignancies, some fatal, have been reported among children, adolescents and young adults (up to 22 years of age) treated with TNF-antagonists (initiation of therapy ≤ 18 years of age), including adalimumab in the post marketing setting. Approximately half the cases were lymphomas. The other cases represented a variety of different malignancies and included rare malignancies usually associated with immunosuppression. A risk for the development of malignancies in children and adolescents treated with TNF-antagonists cannot be excluded.

Rare postmarketing cases of hepatosplenic T-cell lymphoma have been identified in patients treated with adalimumab. This rare type of T-cell lymphoma has a very aggressive disease course and is usually fatal. Some of these hepatosplenic T-cell lymphomas with adalimumab have occurred in young adult patients on concomitant treatment with azathioprine or 6-mercaptopurine used for inflammatory bowel disease. The potential risk with the combination of azathioprine or 6-mercaptopurine and adalimumab should be carefully considered. A risk for the development of hepatosplenic T-cell lymphoma in patients treated with Hulio cannot be excluded (see section 4.8).

No studies have been conducted that include patients with a history of malignancy or in whom treatment with adalimumab is continued following development of malignancy. Thus additional caution should be exercised in considering adalimumab treatment of these patients (see section 4.8).

All patients, and in particular patients with a medical history of extensive immunosuppressant therapy or psoriasis patients with a history of PUVA treatment should be examined for the presence of non-melanoma skin cancer prior to and during treatment with Hulio. Melanoma and Merkel cell carcinoma have also been reported in patients treated with TNF-antagonists including adalimumab (see section 4.8).

In an exploratory clinical trial evaluating the use of another TNF-antagonist, infliximab, in patients with moderate to severe chronic obstructive pulmonary disease (COPD), more malignancies, mostly in the lung or head and neck, were reported in infliximab-treated patients compared with control patients. All patients had a history of heavy smoking. Therefore, caution should be exercised when using any TNF-antagonist in COPD patients, as well as in patients with increased risk for malignancy due to heavy smoking.
With current data it is not known if adalimumab treatment influences the risk for developing dysplasia or colon cancer. All patients with ulcerative colitis who are at increased risk for dysplasia or colon carcinoma (for example, patients with long-standing ulcerative colitis or primary sclerosing cholangitis), or who had a prior history of dysplasia or colon carcinoma should be screened for dysplasia at regular intervals before therapy and throughout their disease course. This evaluation should include colonoscopy and biopsies per local recommendations.

**Haematologic reactions**

Rare reports of pancytopenia including aplastic anaemia have been reported with TNF-antagonists. Adverse events of the haematologic system, including medically significant cytopenia (e.g. thrombocytopenia, leukopenia) have been reported with adalimumab. All patients should be advised to seek immediate medical attention if they develop signs and symptoms suggestive of blood dyscrasias (e.g. persistent fever, bruising, bleeding, pallor) while on Hulio. Discontinuation of Hulio therapy should be considered in patients with confirmed significant haematologic abnormalities.

**Vaccinations**

Similar antibody responses to the standard 23-valent pneumococcal vaccine and the influenza trivalent virus vaccination were observed in a study in 226 adult subjects with rheumatoid arthritis who were treated with adalimumab or placebo. No data are available on the secondary transmission of infection by live vaccines in patients receiving adalimumab.

It is recommended that paediatric patients, if possible, be brought up to date with all immunisations in agreement with current immunisation guidelines prior to initiating adalimumab therapy.

Patients on adalimumab may receive concurrent vaccinations, except for live vaccines. Administration of live vaccines (e.g., BCG vaccine) to infants exposed to adalimumab in utero is not recommended for 5 months following the mother's last adalimumab injection during pregnancy.

**Congestive heart failure**

In a clinical trial with another TNF-antagonist worsening congestive heart failure and increased mortality due to congestive heart failure have been observed. Cases of worsening congestive heart failure have also been reported in patients receiving adalimumab. Hulio should be used with caution in patients with mild heart failure (NYHA class I/II). Hulio is contraindicated in moderate to severe heart failure (see section 4.3). Treatment with Hulio must be discontinued in patients who develop new or worsening symptoms of congestive heart failure.

**Autoimmune processes**

Treatment with Hulio may result in the formation of autoimmune antibodies. The impact of long-term treatment with adalimumab on the development of autoimmune diseases is unknown. If a patient develops symptoms suggestive of a lupus-like syndrome following treatment with Hulio and is positive for antibodies against double-stranded DNA, further treatment with Hulio should not be given (see section 4.8).

**Concurrent administration of biologic DMARDS or TNF-antagonists**

Serious infections were seen in clinical studies with concurrent use of anakinra and another TNF-antagonist, etanercept, with no added clinical benefit compared to etanercept alone. Because of the nature of the adverse events seen with the combination of etanercept and anakinra therapy, similar toxicities may also result from the combination of anakinra and other TNF-antagonists. Therefore, the combination of adalimumab and anakinra is not recommended. (See section 4.5).

Concomitant administration of adalimumab with other biologic DMARDS (e.g. anakinra and abatacept) or other TNF-antagonists is not recommended based upon the possible increased risk for
infections, including serious infections and other potential pharmacological interactions. (See section 4.5).

**Surgery**

There is limited safety experience of surgical procedures in patients treated with adalimumab. The long half-life of adalimumab should be taken into consideration if a surgical procedure is planned. A patient who requires surgery while on Hulio should be closely monitored for infections, and appropriate actions should be taken. There is limited safety experience in patients undergoing arthroplasty while receiving adalimumab.

**Small bowel obstruction**

Failure to respond to treatment for Crohn's disease may indicate the presence of fixed fibrotic stricture that may require surgical treatment. Available data suggest that adalimumab does not worsen or cause strictures.

**Elderly**

The frequency of serious infections among adalimumab treated subjects over 65 years of age (3.7%) was higher than for those under 65 years of age (1.5%). Some of those had a fatal outcome. Particular attention regarding the risk for infection should be paid when treating the elderly.

**Paediatric population**

See Vaccinations above.

**Excipients with known effect**

**Sorbitol**

This medicinal product contains sorbitol (E420). Patients with hereditary fructose intolerance (HFI) should not take/be given this medicinal product.

**Sodium**

This medicinal product contains less than 1 mmol of sodium (23 mg) per 0.8 ml dose, i.e. essentially ‘sodium-free’.

**4.5 Interaction with other medicinal products and other forms of interaction**

Adalimumab has been studied in rheumatoid arthritis, polyarticular juvenile idiopathic arthritis and psoriatic arthritis patients taking adalimumab as monotherapy and those taking concomitant methotrexate. Antibody formation was lower when adalimumab was given together with methotrexate in comparison with use as monotherapy. Administration of adalimumab without methotrexate resulted in increased formation of antibodies, increased clearance and reduced efficacy of adalimumab (see section 5.1).

The combination of Hulio and anakinra is not recommended (see section 4.4 “Concurrent administration of biologic DMARDs or TNF-antagonists”).

The combination of Hulio and abatacept is not recommended (see section 4.4 “Concurrent administration of biologic DMARDs or TNF-antagonists”).
4.6  **Fertility, pregnancy and lactation**

**Women of child bearing potential**

Women of childbearing potential should consider the use of adequate contraception to prevent pregnancy and continue its use for at least five months after the last Hulio treatment.

**Pregnancy**

A large number (approximately 2,100) of prospectively collected pregnancies exposed to adalimumab resulting in live birth with known outcomes, including more than 1,500 exposed during the first trimester, does not indicate an increase in the rate of malformation in the newborn.

In a prospective cohort registry, 257 women with rheumatoid arthritis (RA) or Crohn’s disease (CD) treated with adalimumab at least during the first trimester and 120 women with RA or CD not treated with adalimumab were enrolled. The primary endpoint was the birth prevalence of major birth defects. The rate of pregnancies ending with at least one live born infant with a major birth defect was 6/69 (8.7%) in the adalimumab-treated women with RA and 5/74 (6.8%) in the untreated women with RA (unadjusted OR 1.31, 95% CI 0.38-4.52) and 16/152 (10.5%) in the adalimumab-treated women with CD and 3/32 (9.4%) in the untreated women with CD (unadjusted OR 1.14, 95% CI 0.31-4.16). The adjusted OR (accounting for baseline differences) was 1.10 (95% CI 0.45-2.73) with RA and CD combined. There were no distinct differences between adalimumab-treated and untreated women for the secondary endpoints spontaneous abortions, minor birth defects, preterm delivery, birth size and serious or opportunistic infections and no stillbirths or malignancies were reported. The interpretation of data may be impacted due to methodological limitations of the study, including small sample size and non-randomized design.

In a development toxicity study conducted in monkeys, there was no indication of maternal toxicity, embryotoxicity or teratogenicity. Preclinical data on postnatal toxicity of adalimumab are not available (see section 5.3).

Due to its inhibition of TNFα, adalimumab administered during pregnancy could affect normal immune responses in the newborn. Adalimumab should only be used during pregnancy if clearly needed.

Adalimumab may cross the placenta into the serum of infants born to women treated with adalimumab during pregnancy. Consequently, these infants may be at increased risk for infection. Administration of live vaccines (e.g., BCG vaccine) to infants exposed to adalimumab in utero is not recommended for 5 months following the mother’s last adalimumab injection during pregnancy.

**Breast feeding**

Limited information from the published literature indicates that adalimumab is excreted in breast milk at very low concentrations with the presence of adalimumab in human milk at concentrations of 0.1% to 1% of the maternal serum level. Given orally, immunoglobulin G proteins undergo intestinal proteolysis and have poor bioavailability. No effects on the breastfed newborns/infants are anticipated. Consequently, adalimumab can be used during breastfeeding.

**Fertility**

Preclinical data on fertility effects of adalimumab are not available.

4.7  **Effects on ability to drive and use machines**

Hulio may have a minor influence on the ability to drive and use machines. Vertigo and visual impairment may occur following administration of Hulio (see section 4.8).
4.8 Undesirable effects

Summary of the safety profile

Adalimumab was studied in 9,506 patients in pivotal controlled and open label trials for up to 60 months or more. These trials included rheumatoid arthritis patients with short term and long standing disease, juvenile idiopathic arthritis (polyarticular juvenile idiopathic arthritis and enthesitis-related arthritis) as well as axial spondyloarthritis (ankylosing spondylitis and axial spondyloarthritis without radiographic evidence of AS), psoriatic arthritis, Crohn's disease, ulcerative colitis, psoriasis, hidradenitis suppurativa and uveitis patients. The pivotal controlled studies involved 6,089 patients receiving adalimumab and 3,801 patients receiving placebo or active comparator during the controlled period.

The proportion of patients who discontinued treatment due to adverse events during the double-blind, controlled portion of pivotal studies was 5.9% for patients taking adalimumab and 5.4% for control treated patients.

The most commonly reported adverse reactions are infections (such as nasopharyngitis, upper respiratory tract infection and sinusitis), injection site reactions (erythema, itching, haemorrhage, pain or swelling), headache and musculoskeletal pain.

Serious adverse reactions have been reported for adalimumab. TNF-antagonists, such as adalimumab affect the immune system and their use may affect the body's defence against infection and cancer. Fatal and life-threatening infections (including sepsis, opportunistic infections and TB), HBV reactivation and various malignancies (including leukaemia, lymphoma and HSTCL) have also been reported with use of adalimumab.

Serious haematological, neurological and autoimmune reactions have also been reported. These include rare reports of pancytopenia, aplastic anaemia, central and peripheral demyelinating events and reports of lupus, lupus-related conditions and Stevens-Johnson syndrome.

Paediatric population

In general, the adverse events in paediatric patients were similar in frequency and type to those seen in adult patients.

Tabulated list of adverse reactions

The following list of adverse reactions is based on experience from clinical trials and on postmarketing experience and are displayed by system organ class and frequency in Table 6 below: very common (≥ 1/10); common (≥ 1/100 to < 1/10); uncommon (≥ 1/1,000 to < 1/100); rare (≥ 1/10,000 to < 1/1,000); and not known (cannot be estimated from the available data). Within each frequency grouping, undesirable effects are presented in order of decreasing seriousness. The highest frequency seen among the various indications has been included. An asterisk (*) appears in the System Organ Class (SOC) column if further information is found elsewhere in sections 4.3, 4.4 and 4.8.

</table>

* further information is found elsewhere in sections 4.3, 4.4 and 4.8
** including open label extension studies
¹) including spontaneous reporting data
Hidradenitis suppurativa

The safety profile for patients with HS treated with adalimumab weekly was consistent with the known safety profile of adalimumab.

Uveitis

The safety profile for patients with uveitis treated with adalimumab every other week was consistent with the known safety profile of adalimumab.

Description of selected adverse reactions

Injection site reactions

In the pivotal controlled trials in adults and children, 12.9% of patients treated with adalimumab developed injection site reactions (erythema and/or itching, haemorrhage, pain or swelling), compared to 7.2% of patients receiving placebo or active control. Injection site reactions generally did not necessitate discontinuation of the medicinal product.

Infections

In the pivotal controlled trials in adults and children, the rate of infection was 1.51 per patient year in the adalimumab treated patients and 1.46 per patient year in the placebo and active control-treated patients. The infections consisted primarily of nasopharyngitis, upper respiratory tract infection, and sinusitis. Most patients continued on adalimumab after the infection resolved.

The incidence of serious infections was 0.04 per patient year in adalimumab treated patients and 0.03 per patient year in placebo and active control-treated patients.

In controlled and open label adult and paediatric studies with adalimumab, serious infections (including fatal infections, which occurred rarely) have been reported, which include reports of tuberculosis (including miliary and extra-pulmonary locations) and invasive opportunistic infections (e.g. disseminated or extrapulmonary histoplasmosis, blastomycosis, coccidiodomycosis, pneumocystis candidiasis, aspergillosis and listeriosis). Most of the cases of tuberculosis occurred within the first eight months after initiation of therapy and may reflect recrudescence of latent disease.

Malignancies and lymphoproliferative disorders

No malignancies were observed in 249 paediatric patients with an exposure of 655.6 patient years during adalimumab trials in patients with juvenile idiopathic arthritis (polyarticular juvenile idiopathic arthritis and enthesitis-related arthritis). In addition, no malignancies were observed in 192 paediatric patients with an exposure of 498.1 patient years during adalimumab trials in paediatric patients with Crohn's disease. No malignancies were observed in 77 paediatric patients with an exposure of 80.0 patient years during an adalimumab trial in paediatric patients with chronic plaque psoriasis. No malignancies were observed in 60 paediatric patients with an exposure of 58.4 patient years during an adalimumab trial in paediatric patients with uveitis.

During the controlled portions of pivotal adalimumab trials in adults of at least 12 weeks in duration in patients with moderately to severely active rheumatoid arthritis, ankylosing spondylitis, axial spondyloarthritis without radiographic evidence of AS, psoriatic arthritis, psoriasis, hidradenitis suppurativa, Crohn's disease, ulcerative colitis and uveitis, malignancies, other than lymphoma and non-melanoma skin cancer, were observed at a rate (95% confidence interval) of 6.8 (4.4, 10.5) per 1,000 patient-years among 5,291 adalimumab treated patients versus a rate of 6.3 (3.4, 11.8) per 1,000 patient-years among 3,444 control patients (median duration of treatment was 4.0 months for adalimumab and 3.8 months for control-treated patients). The rate (95% confidence interval) of non-melanoma skin cancers was 8.8 (6.0, 13.0) per 1,000 patient-years among adalimumab-treated patients.
and 3.2 (1.3, 7.6) per 1,000 patient-years among control patients. Of these skin cancers, squamous cell carcinomas occurred at rates (95% confidence interval) of 2.7 (1.4, 5.4) per 1,000 patient-years among adalimumab-treated patients and 0.6 (0.1, 4.5) per 1,000 patient-years among control patients. The rate (95% confidence interval) of lymphomas was 0.7 (0.2, 2.7) per 1,000 patient-years among adalimumab-treated patients and 0.6 (0.1, 4.5) per 1,000 patient-years among control patients.

When combining controlled portions of these trials and ongoing and completed open label extension studies with a median duration of approximately 3.3 years including 6,427 patients and over 26,439 patient-years of therapy, the observed rate of malignancies, other than lymphoma and non-melanoma skin cancers is approximately 8.5 per 1,000 patient years. The observed rate of non-melanoma skin cancers is approximately 9.6 per 1,000 patient years, and the observed rate of lymphomas is approximately 1.3 per 1,000 patient years.

In post-marketing experience from January 2003 to December 2010, predominantly in patients with rheumatoid arthritis, the reported rate of malignancies is approximately 2.7 per 1,000 patient treatment years. The reported rates for non-melanoma skin cancers and lymphomas are approximately 0.2 and 0.3 per 1,000 patient treatment years, respectively (see section 4.4).

Rare post-marketing cases of hepatosplenic T-cell lymphoma have been reported in patients treated with adalimumab (see section 4.4).

**Autoantibodies**

Patients had serum samples tested for autoantibodies at multiple time points in rheumatoid arthritis studies I – V. In these trials, 11.9% of patients treated with adalimumab and 8.1% of placebo and active control – treated patients that had negative baseline anti-nuclear antibody titres reported positive titres at week 24. Two patients out of 3,441 treated with adalimumab in all rheumatoid arthritis and psoriatic arthritis studies developed clinical signs suggestive of new-onset lupus-like syndrome. The patients improved following discontinuation of therapy. No patients developed lupus nephritis or central nervous system symptoms.

**Hepato-biliary events**

In controlled Phase 3 trials of adalimumab in patients with rheumatoid arthritis and psoriatic arthritis with a control period duration ranging from 4 to 104 weeks, ALT elevations ≥ 3 x ULN occurred in 3.7% of adalimumab-treated patients and 1.6% of control-treated patients.

In controlled Phase 3 trials of adalimumab in patients with polyarticular juvenile idiopathic arthritis who were 4 to 17 years and enthesitis-related arthritis who were 6 to 17 years, ALT elevations ≥ 3 x ULN occurred in 6.1% of adalimumab-treated patients and 1.3% of control-treated patients. Most ALT elevations occurred with concomitant methotrexate use. No ALT elevations ≥ 3 x ULN occurred in the Phase 3 trial of adalimumab in patients with polyarticular juvenile idiopathic arthritis who were 2 to <4 years.

In controlled Phase 3 trials of adalimumab in patients with Crohn's disease and ulcerative colitis with a control period ranging from 4 to 52 weeks. ALT elevations ≥ 3 x ULN occurred in 0.9% of adalimumab-treated patients and 0.9% of controlled-treated patients.

In the Phase 3 trial of adalimumab in patients with paediatric Crohn's disease which evaluated efficacy and safety of two body weight adjusted maintenance dose regimens following body weight adjusted induction therapy up to 52 weeks of treatment, ALT elevations ≥ 3 x ULN occurred in 2.6% (5/192) of patients of whom 4 were receiving concomitant immunosuppressants at baseline.

In controlled Phase 3 trials of adalimumab in patients with plaque Psoriasis with a control period duration ranging from 12 to 24 weeks, ALT elevations ≥ 3 x ULN occurred in 1.8% of adalimumab-treated patients and 1.8% of control-treated patients.
No ALT elevations ≥3 X ULN occurred in the Phase 3 trial of adalimumab in paediatric patients with plaque psoriasis.

In controlled trials of adalimumab (initial doses of 160 mg at week 0 and 80 mg at week 2, followed by 40 mg every week starting at week 4), in patients with hidradenitis suppurativa with a control period duration ranging from 12 to 16 weeks, ALT elevations ≥ 3 X ULN occurred in 0.3% of adalimumab-treated patients and 0.6% of control-treated patients.

In controlled trials of adalimumab (initial doses of 80 mg at week 0 followed by 40 mg every other week starting at week 1) in adult patients with uveitis up to 80 weeks with a median exposure of 166.5 days and 105.0 days in adalimumab-treated and control-treated patients, respectively, ALT elevations ≥ 3 X ULN occurred in 2.4% of adalimumab-treated patients and 2.4% of control-treated patients.

Across all indications in clinical trials patients with raised ALT were asymptomatic and in most cases elevations were transient and resolved on continued treatment. However, there have also been post-marketing reports of liver failure as well as less severe liver disorders that may precede liver failure, such as hepatitis including autoimmune hepatitis in patients receiving adalimumab.

Concurrent treatment with azathioprine/6-mercaptopurine

In adult Crohn's disease studies, higher incidences of malignant and serious infection-related adverse events were seen with the combination of adalimumab and azathioprine/6-mercaptopurine compared with adalimumab alone.

Reporting of suspected adverse reactions

Reporting suspected adverse reactions after authorisation of the medicinal product is important. It allows continued monitoring of the benefit/risk balance of the medicinal product. Healthcare professionals are asked to report any suspected adverse reactions via the national reporting system listed in Appendix V.

4.9 Overdose

No dose-limiting toxicity was observed during clinical trials. The highest dose level evaluated has been multiple intravenous doses of 10 mg/kg, which is approximately 15 times the recommended dose.

5. PHARMACOLOGICAL PROPERTIES

5.1 Pharmacodynamic properties

Pharmacotherapeutic group: Immunosuppressants, Tumour Necrosis Factor alpha (TNF-α) inhibitors. ATC code: L04AB04

Mechanism of action

Adalimumab binds specifically to TNF and neutralises the biological function of TNF by blocking its interaction with the p55 and p75 cell surface TNF receptors.

Adalimumab also modulates biological responses that are induced or regulated by TNF, including changes in the levels of adhesion molecules responsible for leukocyte migration (ELAM-1, VCAM-1, and ICAM-1 with an IC₅₀ of 0.1-0.2 nM).
Pharmacodynamic effects

After treatment with adalimumab, a rapid decrease in levels of acute phase reactants of inflammation (C-reactive protein (CRP) and erythrocyte sedimentation rate (ESR)) and serum cytokines (IL-6) was observed, compared to baseline in patients with rheumatoid arthritis. Serum levels of matrix metalloproteinases (MMP-1 and MMP-3) that produce tissue remodelling responsible for cartilage destruction were also decreased after adalimumab administration. Patients treated with adalimumab usually experienced improvement in haematological signs of chronic inflammation.

A rapid decrease in CRP levels was also observed in patients with polyarticular juvenile idiopathic arthritis, Crohn’s disease, ulcerative colitis and hidradenitis suppurativa after treatment with adalimumab. In patients with Crohn’s disease, a reduction of the number of cells expressing inflammatory markers in the colon including a significant reduction of expression of TNFα was seen. Endoscopic studies in intestinal mucosa have shown evidence of mucosal healing in adalimumab treated patients.

Clinical efficacy and safety

Rheumatoid arthritis

Adalimumab was evaluated in over 3,000 patients in all rheumatoid arthritis clinical trials. The efficacy and safety of adalimumab were assessed in five randomised, double-blind and well-controlled studies. Some patients were treated for up to 120 months duration.

RA study I evaluated 271 patients with moderately to severely active rheumatoid arthritis who were ≥ 18 years old, had failed therapy with at least one disease-modifying, anti rheumatic drug and had insufficient efficacy with methotrexate at doses of 12.5 to 25 mg (10 mg if methotrexate-intolerant) every week and whose methotrexate dose remained constant at 10 to 25 mg every week. Doses of 20, 40 or 80 mg of adalimumab or placebo were given every other week for 24 weeks.

RA study II evaluated 544 patients with moderately to severely active rheumatoid arthritis who were ≥ 18 years old and had failed therapy with at least one disease-modifying, anti-rheumatic drugs. Doses of 20 or 40 mg of adalimumab were given by subcutaneous injection every other week with placebo on alternative weeks or every week for 26 weeks; placebo was given every week for the same duration. No other disease-modifying anti-rheumatic drugs were allowed.

RA study III evaluated 619 patients with moderately to severely active rheumatoid arthritis who were ≥ 18 years old, and who had an ineffective response to methotrexate at doses of 12.5 to 25 mg or have been intolerant to 10 mg of methotrexate every week. There were three groups in this study. The first received placebo injections every week for 52 weeks. The second received 20 mg of adalimumab every week for 52 weeks. The third group received 40 mg of adalimumab every other week with placebo injections on alternate weeks. Upon completion of the first 52 weeks, 457 patients enrolled in an open-label extension phase in which 40 mg of adalimumab/MTX was administered every other week up to 10 years.

RA study IV primarily assessed safety in 636 patients with moderately to severely active rheumatoid arthritis who were ≥ 18 years old. Patients were permitted to be either disease-modifying, anti-rheumatic drug-naïve or to remain on their pre-existing rheumatologic therapy provided that therapy was stable for a minimum of 28 days. These therapies include methotrexate, leflunomide, hydroxychloroquine, sulfasalazine and/or gold salts. Patients were randomised to 40 mg of adalimumab or placebo every other week for 24 weeks.

RA study V evaluated 799 methotrexate-naïve, adult patients with moderate to severely active early rheumatoid arthritis (mean disease duration less than 9 months). This study evaluated the efficacy of adalimumab 40 mg every other week/methotrexate combination therapy, adalimumab 40 mg every other week monotherapy and methotrexate monotherapy in reducing the signs and symptoms and rate
of progression of joint damage in rheumatoid arthritis for 104 weeks. Upon completion of the first 104 weeks, 497 patients enrolled in an open-label extension phase in which 40 mg of adalimumab was administered every other week up to 10 years.

The primary end point in RA studies I, II and III and the secondary endpoint in RA study IV was the percent of patients who achieved an ACR 20 response at week 24 or 26. The primary endpoint in RA study V was the percent of patients who achieved an ACR 50 response at week 52. RA studies III and V had an additional primary endpoint at 52 weeks of retardation of disease progression (as detected by X-ray results). RA study III also had a primary endpoint of changes in quality of life.

**ACR response**

The percent of adalimumab-treated patients achieving ACR 20, 50 and 70 responses was consistent across RA studies I, II and III. The results for the 40 mg every other week dose are summarised in Table 7.

<sup>a</sup> RA study I at 24 weeks, RA study II at 26 weeks, and RA study III at 24 and 52 weeks

<sup>b</sup> 40 mg adalimumab administered every other week

<sup>c</sup> MTX = methotrexate

**p < 0.01, adalimumab versus placebo**

In RA studies I-IV, all individual components of the ACR response criteria (number of tender and swollen joints, physician and patient assessment of disease activity and pain, disability index (HAQ) scores and CRP (mg/dl) values) improved at 24 or 26 weeks compared to placebo. In RA study III, these improvements were maintained throughout 52 weeks.

In the open-label extension for RA study III, most patients who were ACR responders maintained response when followed for up to 10 years. Of 207 patients who were randomised to adalimumab 40 mg every other week, 114 patients continued on adalimumab 40 mg every other week for 5 years. Among those, 86 patients (75.4%) had ACR 20 responses; 72 patients (63.2%) had ACR 50 responses; and 41 patients (36%) had ACR 70 responses. Of 207 patients, 81 patients continued on adalimumab 40 mg every other week for 10 years. Among those, 64 patients (79.0%) had ACR 20 responses; 56 patients (69.1%) had ACR 50 responses; and 43 patients (53.1%) had ACR 70 responses.

In RA study IV, the ACR 20 response of patients treated with adalimumab plus standard of care was statistically significantly better than patients treated with placebo plus standard of care (p < 0.001).

In RA studies I-IV, adalimumab-treated patients achieved statistically significant ACR 20 and 50 responses compared to placebo as early as one to two weeks after initiation of treatment.
In RA study V with early rheumatoid arthritis patients who were methotrexate naïve, combination therapy with adalimumab and methotrexate led to faster and significantly greater ACR responses than methotrexate monotherapy and adalimumab monotherapy at week 52 and responses were sustained at week 104 (see Table 8).

<sup>a</sup> p-value is from the pairwise comparison of methotrexate monotherapy and adalimumab/methotrexate combination therapy using the Mann-Whitney U test.

<sup>b</sup> p-value is from the pairwise comparison of adalimumab monotherapy and adalimumab/methotrexate combination therapy using the Mann-Whitney U test.

<sup>c</sup> p-value is from the pairwise comparison of adalimumab monotherapy and methotrexate monotherapy using the Mann-Whitney U test.

In the open-label extension for RA study V, ACR response rates were maintained when followed for up to 10 years. Of 542 patients who were randomised to adalimumab 40 mg every other week, 170 patients continued on adalimumab 40 mg every other week for 10 years. Among those, 154 patients (90.6%) had ACR 20 responses; 127 patients (74.7%) had ACR 50 responses; and 102 patients (60.0%) had ACR 70 responses.

At week 52, 42.9% of patients who received adalimumab/methotrexate combination therapy achieved clinical remission (DAS28 (CRP) < 2.6) compared to 20.6% of patients receiving methotrexate monotherapy and 23.4% of patients receiving adalimumab monotherapy. Adalimumab/methotrexate combination therapy was clinically and statistically superior to methotrexate (p < 0.001) and adalimumab monotherapy (p < 0.001) in achieving a low disease state in patients with recently diagnosed moderate to severe rheumatoid arthritis. The response for the two monotherapy arms was similar (p = 0.447). Of 342 subjects originally randomized to adalimumab monotherapy or adalimumab/methotrexate combination therapy who entered the open-label extension study, 171 subjects completed 10 years of adalimumab treatment. Among those, 109 subjects (63.7%) were reported to be in remission at 10 years.

**Radiographic response**

In RA study III, where adalimumab treated patients had a mean duration of rheumatoid arthritis of approximately 11 years, structural joint damage was assessed radiographically and expressed as change in modified Total Sharp Score (TSS) and its components, the erosion score and joint space narrowing score. Adalimumab/methotrexate patients demonstrated significantly less radiographic progression than patients receiving methotrexate alone at 6 and 12 months (see Table 9).

In the open-label extension of RA Study III, the reduction in rate of progression of structural damage is maintained for 8 and 10 years in a subset of patients. At 8 years, 81 of 207 patients originally treated with 40 mg adalimumab every other week were evaluated radiographically. Among those, 48 patients showed no progression of structural damage defined by a change from baseline in the mTSS of 0.5 or less. At 10 years, 79 of 207 patients originally treated with 40 mg adalimumab every other week were
evaluated radiographically. Among those, 40 patients showed no progression of structural damage defined by a change from baseline in the mTSS of 0.5 or less.

\(^c\) p-value is from the pairwise comparison of adalimumab monotherapy and methotrexate monotherapy using the Mann-Whitney U test

Following 52 weeks and 104 weeks of treatment, the percentage of patients without progression (change from baseline in modified Total Sharp Score ≤ 0.5) was significantly higher with adalimumab/methotrexate combination therapy (63.8% and 61.2% respectively) compared to methotrexate monotherapy (37.4% and 33.5% respectively, p < 0.001) and adalimumab monotherapy (50.7%, p < 0.002 and 44.5%, p < 0.001 respectively).

In the open-label extension of RA study V, the mean change from baseline at Year 10 in the modified Total Sharp Score was 10.8, 9.2 and 3.9 in patients originally randomized to methotrexate monotherapy, adalimumab monotherapy and adalimumab/methotrexate combination therapy, respectively. The corresponding proportions of patients with no radiographic progression were 31.3%, 23.7% and 36.7% respectively.

**Quality of life and physical function**

Health-related quality of life and physical function were assessed using the disability index of the Health Assessment Questionnaire (HAQ) in the four original adequate and well-controlled trials, which was a pre-specified primary endpoint at week 52 in RA study III. All doses/schedules of
adalimumab in all four studies showed statistically significantly greater improvement in the disability index of the HAQ from baseline to Month 6 compared to placebo and in RA study III the same was seen at week 52. Results from the Short Form Health Survey (SF 36) for all doses/schedules of adalimumab in all four studies support these findings, with statistically significant physical component summary (PCS) scores, as well as statistically significant pain and vitality domain scores for the 40 mg every other week dose. A statistically significant decrease in fatigue as measured by functional assessment of chronic illness therapy (FACIT) scores was seen in all three studies in which it was assessed (RA studies I, III, IV).

In RA study III, most subjects who achieved improvement in physical function and continued treatment maintained improvement through week 520 (120 months) of open-label treatment. Improvement in quality of life was measured up to week 156 (36 months) and improvement was maintained through that time.

In RA study V, the improvement in the HAQ disability index and the physical component of the SF 36 showed greater improvement (p < 0.001) for adalimumab /methotrexate combination therapy versus methotrexate monotherapy and adalimumab monotherapy at week 52, which was maintained through week 104. Among the 250 subjects who completed the open-label extension study, improvements in physical function were maintained through 10 years of treatment.

**Juvenile idiopathic arthritis (JIA)**

**Polyarticular juvenile idiopathic arthritis (pJIA)**

The safety and efficacy of adalimumab was assessed in two studies (pJIA I and II) in children with active polyarticular or polyarticular course juvenile idiopathic arthritis, who had a variety of JIA onset types (most frequently rheumatoid-factor negative or positive polyarthritis and extended oligoarthritis).

**pJIA I**

The safety and efficacy of adalimumab were assessed in a multicentre, randomised, double-blind, parallel-group study in 171 children (4-17 years old) with polyarticular JIA. In the open-label lead in phase (OL LI) patients were stratified into two groups, MTX (methotrexate)-treated or non-MTX-treated. Patients who were in the non-MTX stratum were either naïve to or had been withdrawn from MTX at least two weeks prior to study drug administration. Patients remained on stable doses of NSAIDs and or prednisone (≤ 0.2 mg/kg/day or 10 mg/day maximum). In the OL LI phase all patients received 24 mg/m² up to a maximum of 40 mg adalimumab every other week for 16 weeks. The distribution of patients by age and minimum, median and maximum dose received during the OL LI phase is presented in Table 11.

Patients demonstrating a Pediatric ACR 30 response at week 16 were eligible to be randomised into the double blind (DB) phase and received either adalimumab 24 mg/m² up to a maximum of 40 mg, or placebo every other week for an additional 32 weeks or until disease flare. Disease flare criteria were defined as a worsening of ≥ 30% from baseline in ≥ 3 of 6 Pediatric ACR core criteria, ≥ 2 active joints, and improvement of > 30% in no more than 1 of the 6 criteria. After 32 weeks or at disease flare, patients were eligible to enrol into the open label extension phase.

</table>

\( a\) Ped ACR 30/50/70 responses week 48 significantly greater than those of placebo treated patients

\( b\) \( p = 0.015\)

\( c\) \( p = 0.031\)

Amongst those who responded at week 16 (n=144), the Pediatric ACR 30/50/70/90 responses were maintained for up to six years in the OLE phase in patients who received adalimumab throughout the study. Over all 19 subjects, of which 11 of the baseline age group 4 to 12 and 8 of the baseline age group 13 to 17 years were treated 6 years or longer.

Overall responses were generally better and, fewer patients developed antibodies when treated with the combination of adalimumab and MTX compared to adalimumab alone. Taking these results into consideration, adalimumab is recommended for use in combination with MTX and for use as monotherapy in patients for whom MTX use is not appropriate (see section 4.2).

pJIA II

The safety and efficacy of adalimumab was assessed in an open-label, multicentre study in 32 children (2 - <4 years old or aged 4 and above weighing < 15 kg) with moderately to severely active polyarticular JIA. The patients received 24 mg/m\(^2\) body surface area (BSA) of adalimumab up to a maximum of 20 mg every other week as a single dose via SC injection for at least 24 weeks. During the study, most subjects used concomitant MTX, with fewer reporting use of corticosteroids or NSAIDs.

At week 12 and week 24, PedACR30 response was 93.5% and 90.0%, respectively, using the observed data approach. The proportions of subjects with PedACR50/70/90 at week 12 and week 24 were 90.3%/61.3%/38.7% and 83.3%/73.3%/36.7%, respectively. Amongst those who responded (Pediatric ACR 30) at week 24 (n=27 out of 30 patients), the Pediatric ACR 30 responses were maintained for up to 60 weeks in the OLE phase in patients who received adalimumab throughout this time period. Overall, 20 subjects were treated for 60 weeks or longer.

Enthesitis-related arthritis

The safety and efficacy of adalimumab were assessed in a multicentre, randomised, double-blind study in 46 paediatric patients (6 to 17 years old) with moderate enthesitis-related arthritis. Patients were randomised to receive either 24 mg/m\(^2\) body surface area (BSA) of adalimumab up to a maximum of 40 mg, or placebo every other week for 12 weeks. The double-blind period is followed by an open-label (OL) period during which patients received 24 mg/m\(^2\) BSA of adalimumab up to a maximum of 40 mg every other week subcutaneously for up to an additional 192 weeks. The primary endpoint was the percent change from Baseline to week 12 in the number of active joints with arthritis (swelling not due to deformity or joints with loss of motion plus pain and/or tenderness), which was achieved with
mean percent decrease of -62.6% (median percent change -88.9%) in patients in the adalimumab group compared to -11.6% (median percent change -50.0%) in patients in the placebo group. Improvement in number of active joints with arthritis was maintained during the OL period through week 156 for the 26 of 31 (84%) patients in the adalimumab group who remained in the study. Although not statistically significant, the majority of patients demonstrated clinical improvement in secondary endpoints such as number of sites of enthesitis, tender joint count (TJC), swollen joint count (SJC), Pediatric ACR 50 response, and Pediatric ACR 70 response.

*Axial spondyloarthritis*

*Ankylosing spondylitis (AS)*

Adalimumab 40 mg every other week was assessed in 393 patients in two randomised, 24 week double-blind, placebo-controlled studies in patients with active ankylosing spondylitis (mean baseline score of disease activity [Bath Ankylosing Spondylitis Disease Activity Index (BASDAI)] was 6.3 in all groups) who have had an inadequate response to conventional therapy. Seventy-nine (20.1%) patients were treated concomitantly with disease modifying anti-rheumatic drugs, and 37 (9.4%) patients with glucocorticoids. The blinded period was followed by an open-label period during which patients received adalimumab 40 mg every other week subcutaneously for up to an additional 28 weeks. Subjects (n=215, 54.7%) who failed to achieve ASAS 20 at weeks 12, or 16 or 20 received early escape open-label adalimumab 40 mg every other week subcutaneously and were subsequently treated as non-responders in the double-blind statistical analyses.

In the larger AS study I with 315 patients, results showed statistically significant improvement of the signs and symptoms of ankylosing spondylitis in patients treated with adalimumab compared to placebo. Significant response was first observed at week 2 and maintained through 24 weeks (Table 13).

***, ** Statistically significant at p < 0.001, < 0.01 for all comparisons between adalimumab and placebo at weeks 2, 12 and 24
a Assessments in Ankylosing Spondylitis
b Bath Ankylosing Spondylitis Disease Activity Index

Adalimumab treated patients had significantly greater improvement at week 12 which was maintained through week 24 in both the SF36 and Ankylosing Spondylitis Quality of Life Questionnaire (ASQoL).

Similar trends (not all statistically significant) were seen in the smaller randomised, double – blind, placebo controlled AS study II of 82 adult patients with active ankylosing spondylitis.

**Axial spondyloarthritis without radiographic evidence of AS**

The safety and efficacy of adalimumab were assessed in two randomized, double-blind placebo controlled studies in patients with non-radiographic axial spondyloarthritis (nr-axSpA). Study nr-axSpA I evaluated patients with active nr-axSpA. Study nr-axSpA II was a treatment withdrawal study in nr-axSpA patients who achieved remission during open-label treatment with adalimumab.

Study nr-axSpA I

In Study nr-axSpA I, adalimumab 40 mg every other week was assessed in 185 patients in a randomised, 12 week double - blind, placebo - controlled study in patients with active nr-axSpA (mean baseline score of disease activity [Bath Ankylosing Spondylitis Disease Activity Index (BASDAI)] was 6.4 for patients treated with adalimumab and 6.5 for those on placebo) who have had an inadequate response to or intolerance to ≥ 1 NSAIDs, or a contraindication for NSAIDs.

Thirty-three (18%) patients were treated concomitantly with disease modifying anti-rheumatic drugs, and 146 (79%) patients with NSAIDs at baseline. The double-blind period was followed by an open-label period during which patients receive adalimumab 40 mg every other week subcutaneously for up to an additional 144 weeks. week 12 results showed statistically significant improvement of the signs
and symptoms of active nr-axSpA in patients treated with adalimumab compared to placebo (Table 14).

***, **, * Statistically significant at p < 0.001, < 0.01, and < 0.05, respectively, for all comparisons between adalimumab and placebo.

In the open-label extension, improvement in the signs and symptoms was maintained with adalimumab therapy through week 156.

**Inhibition of inflammation**

Significant improvement of signs of inflammation as measured by hs-CRP and MRI of both Sacroiliac Joints and the Spine was maintained in adalimumab-treated patients through week 156 and week 104, respectively.

**Quality of life and physical function**

Health-related quality of life and physical function were assessed using the HAQ-S and the SF-36 questionnaires. Adalimumab showed statistically significantly greater improvement in the HAQ-S total score and the SF-36 Physical Component Score (PCS) from baseline to week 12 compared to placebo. Improvement in health-related quality of life and physical function was maintained during the open-label extension through week 156.

**Study nr-axSpA II**

673 patients with active nr-axSpA (mean baseline disease activity [BASDAI] was 7.0) who had an inadequate response to ≥ 2 NSAIDs, or an intolerance to or a contraindication for NSAIDs enrolled into the open-label period of Study nr-axSpA II during which they received adalimumab 40 mg eow for 28 weeks. These patients also had objective evidence of inflammation in the sacroiliac joints or spine on MRI or elevated hs-CRP. Patients who achieved sustained remission for at least 12 weeks
(N=305) (ASDAS < 1.3 at weeks 16, 20, 24, and 28) during the open-label period were then randomized to receive either continued treatment with adalimumab 40 mg eow (N=152) or placebo (N=153) for an additional 40 weeks in a double-blind, placebo-controlled period (total study duration 68 weeks). Subjects who flared during the double-blind period were allowed adalimumab 40 mg eow rescue therapy for at least 12 weeks.

The primary efficacy endpoint was the proportion of patients with no flare by week 68 of the study. Flare was defined as ASDAS ≥ 2.1 at two consecutive visits four weeks apart. A greater proportion of patients on adalimumab had no disease flare during the double-blind period, when compared with those on placebo (70.4% vs. 47.1%, p<0.001) (Figure 1).

**Figure 1: Kaplan-Meier Curves Summarizing Time to Flare in Study nr-axSpA II**

![Kaplan-Meier Curves](image)

Note: P = Placebo (Number at Risk (flared)); A = Adalimumab (Number at Risk (flared)).

Among the 68 patients who flared in the group allocated to treatment withdrawal, 65 completed 12 weeks of rescue therapy with adalimumab, out of which 37 (56.9%) had regained remission (ASDAS < 1.3) after 12 weeks of restarting the open-label treatment.

By week 68, patients receiving continuous adalimumab treatment showed statistically significant greater improvement of the signs and symptoms of active nr-axSpA as compared to patients allocated to treatment withdrawal during the double-blind period of the study (Table 15).

Psoriatic arthritis

Adalimumab, 40 mg every other week, was studied in patients with moderately to severely active psoriatic arthritis in two placebo-controlled studies, PsA studies I and II. PsA study I with 24 week duration, treated 313 adult patients who had an inadequate response to non-steroidal anti-inflammatory drug therapy and of these, approximately 50% were taking methotrexate. PsA study II with 12-week duration, treated 100 patients who had an inadequate response to DMARD therapy. Upon completion of both studies, 383 patients enrolled in an open-label extension study, in which 40 mg adalimumab was administered every other week.

There is insufficient evidence of the efficacy of adalimumab in patients with ankylosing spondylitis-like psoriatic arthropathy due to the small number of patients studied.

N/A not applicable

ACR responses in PsA study I were similar with and without concomitant methotrexate therapy. ACR responses were maintained in the open-label extension study for up to 136 weeks.

Radiographic changes were assessed in the psoriatic arthritis studies. Radiographs of hands, wrists, and feet were obtained at baseline and week 24 during the double-blind period when patients were on
adalimumab or placebo and at week 48 when all patients were on open-label adalimumab. A modified Total Sharp Score (mTSS), which included distal interphalangeal joints (i.e. not identical to the TSS used for rheumatoid arthritis), was used.

Adalimumab treatment reduced the rate of progression of peripheral joint damage compared with placebo treatment as measured by change from baseline in mTSS (mean ± SD) 0.8 ± 2.5 in the placebo group (at week 24) compared with 0.0 ± 1.9; (p< 0.001) in the adalimumab group (at week 48).

In subjects treated with adalimumab with no radiographic progression from baseline to week 48 (n=102), 84% continued to show no radiographic progression through 144 weeks of treatment. Adalimumab treated patients demonstrated statistically significant improvement in physical function as assessed by HAQ and Short Form Health Survey (SF 36) compared to placebo at week 24. Improved physical function continued during the open label extension up to week 136.

Psoriasis

The safety and efficacy of adalimumab were studied in adult patients with chronic plaque psoriasis (≥ 10% BSA involvement and Psoriasis Area and Severity Index (PASI) ≥ 12 or ≥ 10) who were candidates for systemic therapy or phototherapy in randomised, double-blind studies. 73% of patients enrolled in Psoriasis Studies I and II had received prior systemic therapy or phototherapy. The safety and efficacy of adalimumab were also studied in adult patients with moderate to severe chronic plaque psoriasis with concomitant hand and/or foot psoriasis who were candidates for systemic therapy in a randomised double-blind study (Psoriasis Study III).

Psoriasis Study I (REVEAL) evaluated 1,212 patients within three treatment periods. In period A, patients received placebo or adalimumab at an initial dose of 80 mg followed by 40 mg every other week starting one week after the initial dose. After 16 weeks of therapy, patients who achieved at least a PASI 75 response (PASI score improvement of at least 75% relative to baseline), entered period B and received open-label 40 mg adalimumab every other week. Patients who maintained ≥PASI 75 response at week 33 and were originally randomised to active therapy in Period A, were re-randomised in period C to receive 40 mg adalimumab every other week or placebo for an additional 19 weeks. Across all treatment groups, the mean baseline PASI score was 18.9 and the baseline Physician's Global Assessment (PGA) score ranged from “moderate” (53% of subjects included) to “severe” (41%) to “very severe” (6%).

Psoriasis Study II (CHAMPION) compared the efficacy and safety of adalimumab versus methotrexate and placebo in 271 patients. Patients received placebo, an initial dose of MTX 7.5 mg and thereafter dose increases up to week 12, with a maximum dose of 25 mg or an initial dose of 80 mg adalimumab followed by 40 mg every other week (starting one week after the initial dose) for 16 weeks. There are no data available comparing adalimumab and MTX beyond 16 weeks of therapy. Patients receiving MTX who achieved a ≥PASI 50 response at week 8 and/or 12 did not receive further dose increases. Across all treatment groups, the mean baseline PASI score was 19.7 and the baseline PGA score ranged from “mild” (<1%) to “moderate” (48%) to “severe” (46%) to “very severe” (6%).

Patients participating in all Phase 2 and Phase 3 psoriasis studies were eligible to enrol into an open-label extension trial, where adalimumab was given for at least an additional 108 weeks.

In Psoriasis Studies I and II, a primary endpoint was the proportion of patients who achieved a PASI 75 response from baseline at week 16 (see Tables 17 and 18).
In Psoriasis Study I, 28% of patients who were PASI 75 responders and were re-randomised to placebo at week 33 compared to 5% continuing on adalimumab, p<0.001, experienced “loss of adequate response” (PASI score after week 33 and on or before week 52 that resulted in a <PASI 50 response relative to baseline with a minimum of a 6-point increase in PASI score relative to week 33). Of the patients who lost adequate response after re-randomisation to placebo who then enrolled into the open-label extension trial, 38% (25/66) and 55% (36/66) regained PASI 75 response after 12 and 24 weeks of re-treatment, respectively.

A total of 233 PASI 75 responders at week 16 and week 33 received continuous adalimumab therapy for 52 weeks in Psoriasis Study I, and continued adalimumab in the open-label extension trial. PASI 75 and PGA of clear or minimal response rates in these patients were 74.7% and 59.0%, respectively, after an additional 108 weeks of open-label therapy (total of 160 weeks). In an analysis in which all patients who dropped out of the study for adverse events or lack of efficacy, or who dose-escalated, were considered non-responders, PASI 75 and PGA of clear or minimal response rates in these patients were 69.6% and 55.7%, respectively, after an additional 108 weeks of open-label therapy (total of 160 weeks).

A total of 347 stable responders participated in a withdrawal and retreatment evaluation in an open-label extension study. During the withdrawal period, symptoms of psoriasis returned over time with a median time to relapse (decline to PGA “moderate” or worse) of approximately 5 months. None of these patients experienced rebound during the withdrawal period. A total of 76.5% (218/285) of patients who entered the retreatment period had a response of PGA “clear” or “minimal” after 16 weeks of retreatment, irrespective of whether they relapsed during withdrawal (69.1%[123/178] and 88.8% [95/107] for patients who relapsed and who did not relapse during the withdrawal period, respectively). A similar safety profile was observed during retreatment as before withdrawal.

Significant improvements at week 16 from baseline compared to placebo (Studies I and II) and MTX (Study II) were demonstrated in the DLQI (Dermatology Life Quality Index). In Study I, improvements in the physical and mental component summary scores of the SF-36 were also significant compared to placebo.
In an open-label extension study, for patients who dose escalated from 40 mg every other week to 40 mg weekly due to a PASI response below 50%, 26.4% (92/349) and 37.8% (132/349) of patients achieved PASI 75 response at week 12 and 24, respectively.

Psoriasis Study III (REACH) compared the efficacy and safety of adalimumab versus placebo in 72 patients with moderate to severe chronic plaque psoriasis and hand and/or foot psoriasis. Patients received an initial dose of 80 mg adalimumab followed by 40 mg every other week (starting one week after the initial dose) or placebo for 16 weeks. At week 16, a statistically significantly greater proportion of patients who received adalimumab achieved PGA of ‘clear’ or ‘almost clear’ for the hands and/or feet compared to patients who received placebo (30.6% versus 4.3%, respectively [P = 0.014]).

Psoriasis Study IV compared efficacy and safety of adalimumab versus placebo in 217 adult patients with moderate to severe chronic plaque psoriasis and hand and/or foot psoriasis. Patients received an initial dose of 80 mg adalimumab followed by 40 mg every other week (starting one week after the initial dose) or placebo for 26 weeks followed by open-label adalimumab treatment for an additional 26 weeks. Nail psoriasis assessments included the Modified Nail Psoriasis Severity Index (mNAPSI), the Physician’s Global Assessment of Fingernail Psoriasis (PGA-F) and the Nail Psoriasis Severity Index (NAPSI) (see Table 19).

Adalimumab demonstrated a treatment benefit in nail psoriasis patients with different extents of skin involvement (BSA≥10% (60% of patients) and BSA<10% and ≥5% (40% of patients)).

*p<0.001, adalimumab vs. placebo

Adalimumab treated patients showed statistically significant improvements at week 26 compared with placebo in the DLQI.

Paediatric plaque psoriasis

The efficacy of adalimumab was assessed in a randomised, double-blind, controlled study of 114 paediatric patients from 4 years of age with severe chronic plaque psoriasis (as defined by a PGA ≥ 4 or > 20% BSA involvement or > 10% BSA involvement with very thick lesions or PASI ≥ 20 or ≥ 10 with clinically relevant facial, genital, or hand/foot involvement) who were inadequately controlled with topical therapy and heliotherapy or phototherapy.

Patients received adalimumab 0.8 mg/kg eow (up to 40 mg), 0.4 mg/kg eow (up to 20 mg), or methotrexate 0.1 – 0.4 mg/kg weekly (up to 25 mg). At week 16, more patients randomised to adalimumab 0.8 mg/kg had positive efficacy responses (e.g., PASI 75) than those randomised to 0.4 mg/kg eow or MTX.

</tbody>
</table>

a MTX = methotrexate
b P=0.027, adalimumab 0.8 mg/kg versus MTX
c P=0.083, adalimumab 0.8 mg/kg versus MTX

Patients who achieved PASI 75 and PGA clear or minimal were withdrawn from treatment for up to 36 weeks and monitored for loss of disease control (i.e. a worsening of PGA by at least 2 grades). Patients were then re-treated with adalimumab 0.8 mg/kg eow for an additional 16 weeks and response rates observed during retreatment were similar to the previous double-blind period: PASI 75 response of 78.9% (15 of 19 subjects) and PGA clear or minimal of 52.6% (10 of 19 subjects).

In the open label period of the study, PASI 75 and PGA clear or minimal responses were maintained for up to an additional 52 weeks with no new safety findings.

Hidradenitis suppurativa

The safety and efficacy of adalimumab were assessed in randomised, double-blind, placebo-controlled studies and an open-label extension study in adult patients with moderate to severe hidradenitis suppurativa (HS) who were intolerant, had a contraindication or an inadequate response to at least a 3-month trial of systemic antibiotic therapy. The patients in HS-I and HS-II had Hurley Stage II or III disease with at least 3 abscesses or inflammatory nodules.

Study HS-I (PIONEER I) evaluated 307 patients with 2 treatment periods. In Period A, patients received placebo or adalimumab at an initial dose of 160 mg at week 0, 80 mg at week 2, and 40 mg every week starting at week 4 to week 11. Concomitant antibiotic use was not allowed during the study. After 12 weeks of therapy, patients who had received adalimumab in period A were re-randomised in period B to 1 of 3 treatment groups (adalimumab 40 mg every week, adalimumab 40 mg every other week, or placebo from week 12 to week 35). Patients who had been randomised to placebo in Period A were assigned to receive adalimumab 40 mg every week in period B.

Study HS-II (PIONEER II) evaluated 326 patients with 2 treatment periods. In period A, patients received placebo or adalimumab at an initial dose of 160 mg at week 0 and 80 mg at week 2 and 40 mg every week starting at week 4 to week 11. 19.3% of patients had continued baseline oral antibiotic therapy during the study. After 12 weeks of therapy, patients who had received adalimumab in period A were re-randomised in period B to 1 of 3 treatment groups (adalimumab 40 mg every week, adalimumab 40 mg every other week, or placebo from week 12 to week 35). Patients who had been randomised to placebo in period A were assigned to receive placebo in period B.

Patients participating in Studies HS-I and HS-II were eligible to enrol into an open-label extension study in which adalimumab 40 mg was administered every week. Mean exposure in all adalimumab population was 762 days. Throughout all 3 studies patients used topical antiseptic wash daily.

Clinical Response

Reduction of inflammatory lesions and prevention of worsening of abscesses and draining fistulas was assessed using Hidradenitis Suppurativa Clinical Response (HiSCR; at least a 50% reduction in total abscess and inflammatory nodule count with no increase in abscess count and no increase in draining fistula count relative to Baseline). Reduction in HS-related skin pain was assessed using a Numeric Rating Scale in patients who entered the study with an initial baseline score of 3 or greater on a 11 point scale.
At week 12, a significantly higher proportion of patients treated with adalimumab versus placebo achieved HiSCR. At week 12, a significantly higher proportion of patients in Study HS-II experienced a clinically relevant decrease in HS-related skin pain (see Table 21). Patients treated with adalimumab had significantly reduced risk of disease flare during the initial 12 weeks of treatment.

* P < 0.05, ***P < 0.001, adalimumab versus placebo

a Among all randomised patients.
b Among patients with baseline HS-related skin pain assessment ≥ 3, based on Numeric Rating Scale 0 – 10; 0 = no skin pain, 10 = skin pain as bad as you can imagine.

Treatment with adalimumab 40 mg every week significantly reduced the risk of worsening of abscesses and draining fistulas. Approximately twice the proportion of patients in the placebo group in the first 12 weeks of Studies HS-I and HS-II, compared with those in the adalimumab group experienced worsening of abscesses (23.0% vs 11.4%, respectively) and draining fistulas (30.0% vs 13.9%, respectively).

Greater improvements at week 12 from baseline compared to placebo were demonstrated in skin-specific health-related quality of life, as measured by the Dermatology Life Quality Index (DLQI; Studies HS-I and HS-II), patient global satisfaction with medication treatment as measured by the Treatment Satisfaction Questionnaire - medication (TSQM; Studies HS-I and HS-II), and physical health as measured by the physical component summary score of the SF-36 (Study HS-I).

In patients with at least a partial response to adalimumab 40 mg weekly at week 12, the HiSCR rate at week 36 was higher in patients who continued weekly adalimumab than in patients in whom dosing frequency was reduced to every other week, or in whom treatment was withdrawn (see Table 22).

</table>

a Patients with at least a partial response to adalimumab 40 mg weekly after 12 weeks of treatment.
b Patients meeting protocol-specified criteria for loss of response or no improvement were required to discontinue from the studies and were counted as nonresponders.

Among patients who were at least partial responders at week 12, and who received continuous weekly adalimumab therapy, the HiSCR rate at week 48 was 68.3% and at week 96 was 65.1%. Longer term treatment with adalimumab 40 mg weekly for 96 weeks identified no new safety findings.

Among patients whose adalimumab treatment was withdrawn at week 12 in Studies HS-I and HS-II, the HiSCR rate 12 weeks after re-introduction of adalimumab 40 mg weekly returned to levels similar to that observed before withdrawal (56.0%).
Adolescent hidradenitis suppurativa

There are no clinical trials with adalimumab in adolescent patients with HS. Efficacy of adalimumab for the treatment of adolescent patients with HS is predicted based on the demonstrated efficacy and exposure-response relationship in adult HS patients and the likelihood that the disease course, pathophysiology, and drug effects are substantially similar to that of adults at the same exposure levels. Safety of the recommended adalimumab dose in the adolescent HS population is based on cross-indication safety profile of adalimumab in both adults and paediatric patients at similar or more frequent doses (see section 5.2).

Crohn’s disease

The safety and efficacy of adalimumab were assessed in over 1,500 patients with moderately to severely active Crohn’s disease (Crohn’s Disease Activity Index (CDAI) ≥ 220 and ≤ 450) in randomised, double-blind, placebo-controlled studies. Concomitant stable doses of aminosalicylates, corticosteroids, and/or immunomodulatory agents were permitted and 80% of patients continued to receive at least one of these medications.

Induction of clinical remission (defined as CDAI < 150) was evaluated in two studies, CD Study I (CLASSIC I) and CD Study II (GAIN). In CD Study I, 299 TNF-antagonist naive patients were randomised to one of four treatment groups; placebo at weeks 0 and 2, 160 mg adalimumab at week 0 and 80 mg at week 2, 80 mg at week 0 and 40 mg at week 2, and 40 mg at week 0 and 20 mg at week 2. In CD Study II, 325 patients who had lost response or were intolerant to infliximab were randomised to receive either 160 mg adalimumab at week 0 and 80 mg at week 2 or placebo at weeks 0 and 2. The primary non-responders were excluded from the studies and therefore these patients were not further evaluated.

Maintenance of clinical remission was evaluated in CD study III (CHARM). In CD Study III, 854 patients received open-label 80 mg at week 0 and 40 mg at week 2. At week 4 patients were randomised to 40 mg every other , 40 mg every week, or placebo with a total study duration of 56 weeks. Patients in clinical response (decrease in CDAI ≥ 70) at week 4 were stratified and analysed separately from those not in clinical response at week 4. Corticosteroid taper was permitted after week 8.

CD study I and CD study II induction of remission and response rates are presented in Table 23.

Similar remission rates were observed for the 160/80 mg and 80/40 mg induction regimens by week 8 and adverse events were more frequently noted in the 160/80 mg group.
In CD Study III, at week 4, 58% (499/854) of patients were in clinical response and were assessed in the primary analysis. Of those in clinical response at week 4, 48% had been previously exposed to other TNF-antagonists. Maintenance of remission and response rates are presented in Table 24. Clinical remission results remained relatively constant irrespective of previous TNF-antagonist exposure.

Disease-related hospitalisations and surgeries were statistically significantly reduced with adalimumab compared with placebo at week 56.

** p < 0.02 for adalimumab versus placebo pairwise comparisons of proportions
<sup>a</sup> Of those receiving corticosteroids at baseline

Among patients who were not in response at week 4, 43% of adalimumab maintenance patients responded by week 12 compared to 30% of placebo maintenance patients. These results suggest that some patients who have not responded by week 4 benefit from continued maintenance therapy through week 12. Therapy continued beyond 12 weeks did not result in significantly more responses (see section 4.2).

117/276 patients from CD study I and 272/777 patients from CD studies II and III were followed through at least 3 years of open-label adalimumab therapy. 88 and 189 patients, respectively, continued to be in clinical remission. Clinical response (CR-100) was maintained in 102 and 233 patients, respectively.

**Quality of life**

In CD Study I and CD Study II, statistically significant improvement in the disease-specific inflammatory bowel disease questionnaire (IBDQ) total score was achieved at week 4 in patients randomised to adalimumab 80/40 mg and 160/80 mg compared to placebo and was seen at weeks 26 and 56 in CD Study III as well among the adalimumab treatment groups compared to the placebo group.

**Paediatric Crohn's disease**

Adalimumab was assessed in a multicentre, randomised, double-blind clinical trial designed to evaluate the efficacy and safety of induction and maintenance treatment with doses dependent on body weight (< 40 kg or ≥ 40 kg) in 192 paediatric subjects between the ages of 6 and 17 (inclusive) years, with moderate to severe Crohn’s disease (CD) defined as Paediatric Crohn's Disease Activity Index (PCDAI) score > 30. Subjects had to have failed conventional therapy (including a corticosteroid
and/or an immunomodulator) for CD. Subjects may also have previously lost response or been intolerant to infliximab.

All subjects received open-label induction therapy at a dose based on their Baseline body weight: 160 mg at week 0 and 80 mg at week 2 for subjects ≥ 40 kg, and 80 mg and 40 mg, respectively, for subjects < 40 kg.

At week 4, subjects were randomised 1:1 based on their body weight at the time to either the Low Dose or Standard Dose maintenance regimens as shown in Table 25.

**Efficacy results**

The primary endpoint of the study was clinical remission at week 26, defined as PCDAI score ≤ 10.

Clinical remission and clinical response (defined as reduction in PCDAI score of at least 15 points from Baseline) rates are presented in Table 26. Rates of discontinuation of corticosteroids or immunomodulators are presented in Table 27.

¹ p value for Standard Dose versus Low Dose comparison.
² Immunosuppressant therapy could only be discontinued at or after week 26 at the investigator's discretion if the subject met the clinical response criterion.
³ defined as a closure of all fistulas that were draining at Baseline for at least 2 consecutive post-Baseline visits.

Statistically significant increases (improvement) from Baseline to week 26 and 52 in Body Mass Index and height velocity were observed for both treatment groups.

Statistically and clinically significant improvements from Baseline were also observed in both treatment groups for quality of life parameters (including IMPACT III).

One hundred patients (n=100) from the Paediatric CD Study continued in an open-label long-term extension study. After 5 years of adalimumab therapy, 74.0% (37/50) of the 50 patients remaining in the study continued to be in clinical remission, and 92.0% (46/50) of patients continued to be in clinical response per PCDAI.

溃疡性结肠炎

The safety and efficacy of multiple doses of adalimumab were assessed in adult patients with moderately to severely active ulcerative colitis (Mayo score 6 to 12 with endoscopy subscore of 2 to 3) in randomised, double-blind, placebo-controlled studies.

In study UC-I, 390 TNF-antagonist naïve patients were randomised to receive either placebo at weeks 0 and 2, 160 mg adalimumab at week 0 followed by 80 mg at week 2, or 80 mg adalimumab at week 0 followed by 40 mg at week 2. After week 2, patients in both adalimumab arms received 40 mg eow. Clinical remission (defined as Mayo score ≤ 2 with no subscore > 1) was assessed at week 8.

In study UC-II, 248 patients received 160 mg of adalimumab at week 0, 80 mg at week 2 and 40 mg eow thereafter, and 246 patients received placebo. Clinical results were assessed for induction of remission at week 8 and for maintenance of remission at week 52.

Patients induced with 160/80 mg adalimumab achieved clinical remission versus placebo at week 8 in statistically significantly greater percentages in study UC-I (18% vs. 9% respectively, p=0.031) and study UC-II (17% vs. 9% respectively, p=0.019). In study UC-II, among those treated with adalimumab who were in remission at week 8, 21/41 (51%) were in remission at week 52.

Results from the overall UC-II study population are shown in Table 28.

**p<0.001 for adalimumab vs. placebo pairwise comparison of proportions

*Of those receiving corticosteroids at baseline

Of those patients who had a response at week 8, 47% were in response, 29% were in remission, 41% had mucosal healing, and 20% were in steroid-free remission for ≥ 90 days at week 52.

Approximately 40% of patients in study UC-II had failed prior anti-TNF treatment with infliximab. The efficacy of adalimumab in those patients was reduced compared to that in anti-TNF naïve patients. Among patients who had failed prior anti-TNF treatment, week 52 remission was achieved by 3% on placebo and 10% on adalimumab.

Patients from studies UC-I and UC-II had the option to roll over into an open-label long-term extension study (UC III). Following 3 years of adalimumab therapy, 75% (301/402) continued to be in clinical remission per partial Mayo score.

Hospitalisation rates

During 52 weeks of studies UC-I and UC-II, lower rates of all-cause hospitalisations and UC-related hospitalisations were observed for the adalimumab-treated arm compared to the placebo arm. The number of all cause hospitalisations in the adalimumab treatment group was 0.18 per patient year vs. 0.26 per patient year in the placebo group and the corresponding figures for UC-related hospitalisations were 0.12 per patient year vs. 0.22 per patient year.

Quality of life

In study UC-II, treatment with adalimumab resulted in improvements in the Inflammatory Bowel Disease Questionnaire (IBDQ) score.

Uveitis

The safety and efficacy of adalimumab were assessed in adult patients with non-infectious intermediate, posterior, and panuveitis, excluding patients with isolated anterior uveitis, in two randomised, double-masked, placebo-controlled studies (UV I and II). Patients received placebo or adalimumab at an initial dose of 80 mg followed by 40 mg every other week starting one week after the initial dose. Concomitant stable doses of one non-biologic immunosuppressant were permitted.
Study UV I evaluated 217 patients with active uveitis despite treatment with corticosteroids (oral prednisone at a dose of 10 to 60 mg/day). All patients received a standardised dose of prednisone 60 mg/day at study entry followed by a mandatory taper schedule, with complete corticosteroid discontinuation by week 15.

Study UV II evaluated 226 patients with inactive uveitis requiring chronic corticosteroid treatment (oral prednisone 10 to 35 mg/day) at baseline to control their disease. Patients subsequently underwent a mandatory taper schedule, with complete corticosteroid discontinuation by week 19.

The primary efficacy endpoint in both studies was ‘time to treatment failure’. Treatment failure was defined by a multi-component outcome based on inflammatory chorioretinal and/or inflammatory retinal vascular lesions, anterior chamber (AC) cell grade, vitreous haze (VH) grade and best corrected visual acuity (BCVA).

Clinical Response

Results from both studies demonstrated statistically significant reduction of the risk of treatment failure in patients treated with adalimumab versus patients receiving placebo (See Table 29). Both studies demonstrated an early and sustained effect of adalimumab on the treatment failure rate versus placebo (see Figure 2).

Note: Treatment failure at or after week 6 (Study UV I), or at or after week 2 (Study UV II), was counted as event. Drop outs due to reasons other than treatment failure were censored at the time of dropping out.

<sup>a</sup> HR of adalimumab vs placebo from proportional hazards regression with treatment as factor.

<sup>b</sup> 2-sided P value from log rank test.

<sup>c</sup> NE = not estimable. Fewer than half of at-risk subjects had an event.
In Study UV I statistically significant differences in favour of adalimumab versus placebo were observed for each component of treatment failure. In Study UV II, statistically significant differences were observed for visual acuity only, but the other components were numerically in favour of adalimumab.

Of the 417 subjects included in the uncontrolled long-term extension of Studies UV I and UV II, 46 subjects were regarded ineligible (e.g. developed complications secondary to diabetic retinopathy, due to cataract surgery or vitrectomy) and were excluded from the primary analysis of efficacy. Of the 371 remaining patients, 276 evaluable patients reached 78 weeks of open-label adalimumab treatment. Based on the observed data approach, 222 (80.4%) were in quiescence (no active inflammatory lesions, AC cell grade ≤ 0.5+, VH grade ≤ 0.5+) with a concomitant steroid dose ≤ 7.5 mg per day, and 184 (66.7 %) were in steroid-free quiescence. BCVA was either improved or maintained (< 5 letters deterioration) in 88.4% of the eyes at week 78. Among the patients who discontinued the study prior to week 78, 11% discontinued due to adverse events, and 5% due to insufficient response to adalimumab treatment.
Quality of Life

Patient reported outcomes regarding vision-related functioning were measured in both clinical studies, using the NEI VFQ-25. Adalimumab was numerically favoured for the majority of subscores with statistically significant mean differences for general vision, ocular pain, near vision, mental health, and total score in Study UV I, and for general vision and mental health in Study UV II. Vision related effects were not numerically in favour of adalimumab for colour vision in Study UVI and for colour vision, peripheral vision and near vision in Study UV II.

Paediatric Uveitis

The safety and efficacy of adalimumab was assessed in a randomized, double-masked, controlled study of 90 paediatric patients from 2 to < 18 years of age with active JIA-associated noninfectious anterior uveitis who were refractory to at least 12 weeks of methotrexate treatment. Patients received either placebo or 20 mg adalimumab (if < 30 kg) or 40 mg adalimumab (if ≥ 30 kg) every other week in combination with their baseline dose of methotrexate.

The primary endpoint was ‘time to treatment failure’. The criteria determining treatment failure were worsening or sustained non-improvement in ocular inflammation, partial improvement with development of sustained ocular co-morbidities or worsening of ocular co-morbidities, non-permitted use of concomitant medications, and suspension of treatment for an extended period of time.

Clinical Response

Adalimumab significantly delayed the time to treatment failure, as compared to placebo (See Figure 3, P < 0.0001 from log rank test). The median time to treatment failure was 24.1 weeks for subjects treated with placebo, whereas the median time to treatment failure was not estimable for subjects treated with adalimumab because less than one-half of these subjects experienced treatment failure. Adalimumab significantly decreased the risk of treatment failure by 75% relative to placebo, as shown by the hazard ratio (HR = 0.25 [95% CI: 0.12, 0.49]).
Figure 3: Kaplan-Meier Curves Summarizing Time to Treatment Failure in the Paediatric Uveitis Study

Note: P = Placebo (Number at Risk); H = adalimumab (Number at Risk).

Immunogenicity

Anti-adalimumab antibodies may develop during adalimumab treatment. Formation of anti-adalimumab antibodies is associated with increased clearance and reduced efficacy of adalimumab. There is no apparent correlation between the presence of anti-adalimumab antibodies and the occurrence of adverse events.

Paediatric population

The European Medicines Agency has deferred the obligation to submit the results of the studies with the reference medicinal product containing adalimumab in one or more subsets of the paediatric population in ulcerative colitis, see section 4.2 for information on paediatric use.

5.2 Pharmacokinetic properties

Absorption and distribution

After subcutaneous administration of a single 40 mg dose, absorption and distribution of adalimumab was slow, with peak serum concentrations being reached about 5 days after administration. The average absolute bioavailability of adalimumab estimated from three studies following a single 40 mg subcutaneous dose was 64%. After single intravenous doses ranging from 0.25 to 10 mg/kg, concentrations were dose proportional. After doses of 0.5 mg/kg (~40 mg), clearances ranged from 11 to 15 ml/hour, the distribution volume (Vss) ranged from 5 to 6 litres and the mean terminal phase
half-life was approximately two weeks. Adalimumab concentrations in the synovial fluid from several rheumatoid arthritis patients ranged from 31-96% of those in serum.

Following subcutaneous administration of 40 mg of adalimumab every other week in adult rheumatoid arthritis (RA) patients the mean steady-state trough concentrations were approximately 5 μg/ml (without concomitant methotrexate) and 8 to 9 μg/ml (with concomitant methotrexate), respectively. The serum adalimumab trough levels at steady-state increased roughly proportionally with dose following 20, 40 and 80 mg subcutaneous dosing every other week and every week.

Following the administration of 24 mg/m² (up to a maximum of 40 mg) subcutaneously every other week to patients with polyarticular juvenile idiopathic arthritis (JIA) who were 4 to 17 years the mean trough steady-state (values measured from week 20 to 48) serum adalimumab concentration was 5.6 ± 5.6 μg/ml (102% CV) for adalimumab without concomitant methotrexate and 10.9 ± 5.2 μg/ml (47.7% CV) with concomitant methotrexate.

In patients with polyarticular JIA who were 2 to <4 years old or aged 4 and above weighing <15 kg dosed with adalimumab 24 mg/m², the mean trough steady-state serum adalimumab concentrations was 6.0 ± 6.1 μg/ml (101% CV) for adalimumab without concomitant methotrexate and 7.9 ± 5.6 μg/ml (71.2% CV) with concomitant methotrexate.

Following the administration of 24 mg/m² (up to a maximum of 40 mg) subcutaneously every other week to patients with enthesitis-related arthritis who were 6 to 17 years, the mean trough steady-state (values measured at week 24) serum adalimumab concentrations were 8.8 ± 6.6 μg/ml for adalimumab without concomitant methotrexate and 11.8 ± 4.3 μg/ml with concomitant methotrexate.

Following subcutaneous administration of 40 mg of adalimumab every other week in adult non-radiographic axial spondyloarthritis patients, the mean (±SD) trough steady-state concentration at week 68 was 8.0 ± 4.6 μg/ml.

In adult patients with psoriasis, the mean steady-state trough concentration was 5 μg/ml during adalimumab 40 mg every other week monotherapy treatment.

Following the administration of 0.8 mg/kg (up to a maximum of 40 mg) subcutaneously every other week to paediatric patients with chronic plaque psoriasis, the mean ± SD steady-state adalimumab trough concentration was approximately 7.4 ± 5.8 μg/ml (79% CV).

In adult patients with hidradenitis suppurativa, a dose of 160 mg adalimumab on week 0 followed by 80 mg on week 2 achieved serum adalimumab trough concentrations of approximately 7 to 8 μg/ml at week 2 and week 4. The mean steady-state trough concentration at week 12 through week 36 were approximately 8 to 10 μg/ml during adalimumab 40 mg every week treatment.

Adalimumab exposure in adolescent HS patients was predicted using population pharmacokinetic modelling and simulation based on cross-indication pharmacokinetics in other paediatric patients (paediatric psoriasis, juvenile idiopathic arthritis, paediatric Crohn’s disease, and enthesitis-related arthritis). The recommended adolescent HS dosing schedule is 40 mg every other week. Since exposure to adalimumab can be affected by body size, adolescents with higher body weight and inadequate response may benefit from receiving the recommended adult dose of 40 mg every week.

In patients with Crohn’s disease, the loading dose of 80 mg adalimumab on week 0 followed by 40 mg adalimumab on week 2 achieves serum adalimumab trough concentrations of approximately 5.5 μg/ml during the induction period. A loading dose of 160 mg adalimumab on week 0 followed by 80 mg adalimumab on week 2 achieves serum adalimumab trough concentrations of approximately 12 μg/ml during the induction period. Mean steady-state trough levels of approximately 7 μg/ml were observed in Crohn’s disease patients who received a maintenance dose of 40 mg adalimumab every other week.

In paediatric patients with moderate to severe CD, the open-label adalimumab induction dose was 160/80 mg or 80/40 mg at weeks 0 and 2, respectively, dependent on a body weight cut-off of 40 kg.
At week 4, patients were randomised 1:1 to either the Standard Dose (40/20 mg eow) or Low Dose (20/10 mg eow) maintenance treatment groups based on their body weight. The mean (±SD) serum adalimumab trough concentrations achieved at week 4 were 15.7±6.6 μg/ml for patients ≥ 40 kg (160/80 mg) and 10.6±6.1 μg/ml for patients < 40 kg (80/40 mg).

For patients who stayed on their randomised therapy, the mean (±SD) adalimumab trough concentrations at week 52 were 9.5±5.6 μg/ml for the Standard Dose group and 3.5±2.2 μg/ml for the Low Dose group. The mean trough concentrations were maintained in patients who continued to receive adalimumab treatment every 2 weeks. For patients who dose escalated from every other week to weekly regimen, the mean (±SD) serum concentrations of adalimumab at week 52 were 15.3±11.4 μg/ml (40/20 mg, weekly) and 6.7±3.5 μg/ml (20/10 mg, weekly).

In patients with ulcerative colitis, a loading dose of 160 mg adalimumab on week 0 followed by 80 mg adalimumab on week 2 achieves serum adalimumab trough concentrations of approximately 12 μg/ml during the induction period. Mean steady-state trough levels of approximately 8 μg/ml were observed in ulcerative colitis patients who received a maintenance dose of 40 mg adalimumab every other week.

In adult patients with uveitis, a loading dose of 80 mg adalimumab on week 0 followed by 40 mg adalimumab every other week starting at week 1, resulted in mean steady-state concentrations of approximately 8 to 10 μg/ml.

Adalimumab exposure in paediatric uveitis patients was predicted using population pharmacokinetic modelling and simulation based on cross-indication pharmacokinetics in other paediatric patients (paediatric psoriasis, juvenile idiopathic arthritis, paediatric Crohn’s disease, and enthesitis-related arthritis). No clinical exposure data are available on the use of a loading dose in children < 6 years. The predicted exposures indicate that in the absence of methotrexate, a loading dose may lead to an initial increase in systemic exposure.

Population pharmacokinetic and pharmacokinetic/pharmacodynamic modelling and simulation predicted comparable adalimumab exposure and efficacy in patients treated with 80 mg every other week when compared with 40 mg every week (including adult patients with RA, HS, UC, CD or Ps, patients with adolescent HS, and paediatric patients ≥ 40 kg with CD).

Exposure-response relationship in paediatric population

On the basis of clinical trial data in patients with JIA (pJIA and ERA), an exposure-response relationship was established between plasma concentrations and PedACR 50 response. The apparent adalimumab plasma concentration that produces half the maximum probability of PedACR 50 response (EC50) was 3 μg/ml (95% CI: 1-6 μg/ml).

Exposure-response relationships between adalimumab concentration and efficacy in paediatric patients with severe chronic plaque psoriasis were established for PASI 75 and PGA clear or minimal, respectively. PASI 75 and PGA clear or minimal increased with increasing adalimumab concentrations, both with a similar apparent EC50 of approximately 4.5 μg/ml (95% CI 0.4-47.6 and 1.9-10.5, respectively).

Elimination

Population pharmacokinetic analyses with data from over 1,300 RA patients revealed a trend toward higher apparent clearance of adalimumab with increasing body weight. After adjustment for weight differences, gender and age appeared to have a minimal effect on adalimumab clearance. The serum levels of free adalimumab (not bound to anti-adalimumab antibodies, AAA) were observed to be lower in patients with measurable AAA.

Hepatic or renal impairment

Adalimumab has not been studied in patients with hepatic or renal impairment.
5.3 Preclinical safety data

Non-clinical data reveal no special hazard for humans based on studies of single dose toxicity, repeated dose toxicity, and genotoxicity.

An embryo-foetal developmental toxicity/perinatal developmental study has been performed in cynomolgus monkeys at 0, 30 and 100 mg/kg (9-17 monkeys/group) and has revealed no evidence of harm to the foetuses due to adalimumab. Neither carcinogenicity studies, nor a standard assessment of fertility and postnatal toxicity, were performed with adalimumab due to the lack of appropriate models for an antibody with limited cross-reactivity to rodent TNF and to the development of neutralising antibodies in rodents.

Water for injections

6.2 Incompatibilities

In the absence of compatibility studies, this medicinal product must not be mixed with other medicinal products.

6.3 Shelf life

2 years

6.4 Special precautions for storage

Store in a refrigerator (2°C – 8°C). Do not freeze. Keep the pre-filled syringe or pre-filled pen in its outer carton in order to protect from light.

A single Hulio pre-filled syringe or pre-filled pen may be stored at temperatures up to a maximum of 25°C for a period of up to 14 days. The pre-filled syringe or pre-filled pen must be protected from light, and discarded if not used within the 14-day period.

6.5 Nature and contents of container

Hulio 40 mg solution for injection in pre-filled syringe

Hulio 40 mg solution for injection in single-use pre-filled syringe with an automatic needle guard. The syringe is made from cyclo olefin polymer plastic with a stopper (chlorobutyl rubber) and a needle (stainless steel) with a needle cap (butyl/diene blend polymer and polypropylene).

Pack sizes of:
• 1 pre-filled syringe (with 2 alcohol pads)
• 2 pre-filled syringes (with 2 alcohol pads)
• 6 pre-filled syringes (with 6 alcohol pads)
Hulio 40 mg solution for injection in pre-filled pen

Hulio 40 mg solution for injection in single-use pre-filled pen containing a pre-filled syringe. The syringe inside the pen is made from cyclo olefin polymer plastic with a stopper (chlorobutyl rubber) and a needle (stainless steel) with a needle cap (butyl/diene blend polymer and polypropylene).

Pack sizes of:
• 1 pre-filled pen (with 2 alcohol pads)
• 2 pre-filled pens (with 2 alcohol pads)
• 6 pre-filled pens (with 6 alcohol pads)

Not all pack sizes may be marketed.

6.6 Special precautions for disposal

Any unused medicinal product or waste material should be disposed of in accordance with local requirements.

10. DATE OF REVISION OF THE TEXT

Detailed information on this medicinal product is available on the website of the European Medicines Agency http://www.ema.europa.eu.
ANNEX II

A. MANUFACTURER(S) OF THE BIOLOGICAL ACTIVE SUBSTANCE(S) AND MANUFACTURER(S) RESPONSIBLE FOR BATCH RELEASE

B. CONDITIONS OR RESTRICTIONS REGARDING SUPPLY AND USE

C. OTHER CONDITIONS AND REQUIREMENTS OF THE MARKETING AUTHORISATION

D. CONDITIONS OR RESTRICTIONS WITH REGARD TO THE SAFE AND EFFECTIVE USE OF THE MEDICINAL PRODUCT
A. MANUFACTURER(S) OF THE BIOLOGICAL ACTIVE SUBSTANCE(S) AND MANUFACTURER(S) RESPONSIBLE FOR BATCH RELEASE

Name and address of the manufacturer(s) of the biological active substance(s)

Charles River Laboratories
358 Technology Drive
Malvern
Pennsylvania
19355
United States

Kyowa Hakko Kirin Co., Ltd.
Takasaki Plant
100-1 Hagiwara-machi
Takasaki
Gunma
370-0013
Japan

Name and address of the manufacturer(s) responsible for batch release

AndersonBrecon (UK) Limited
Units 2-7
Wye Valley Business Park
Brecon Road
Hay-on-Wye
Hereford
Herefordshire
HR3 5PG
United Kingdom

B. CONDITIONS OR RESTRICTIONS REGARDING SUPPLY AND USE

Medicinal product subject to restricted medical prescription (see Annex I: Summary of Product Characteristics, section 4.2).

C. OTHER CONDITIONS AND REQUIREMENTS OF THE MARKETING AUTHORISATION

- Periodic safety update reports

The requirements for submission of periodic safety update reports for this medicinal product are set out in the list of Union reference dates (EURD list) provided for under Article 107c(7) of Directive 2001/83/EC and any subsequent updates published on the European medicines web-portal.

D. CONDITIONS OR RESTRICTIONS WITH REGARD TO THE SAFE AND EFFECTIVE USE OF THE MEDICINAL PRODUCT

- Risk Management Plan (RMP)

The MAH shall perform the required pharmacovigilance activities and interventions detailed in the agreed RMP presented in Module 1.8.2 of the marketing authorisation and any agreed subsequent updates of the RMP.
An updated RMP should be submitted:

- At the request of the European Medicines Agency;
- Whenever the risk management system is modified, especially as the result of new information being received that may lead to a significant change to the benefit/risk profile or as the result of an important (pharmacovigilance or risk minimisation) milestone being reached.

- Additional risk minimisation measures

Prior to launch of Hulio in each Member State the Marketing Authorisation Holder (MAH) must agree about the content and format of the educational programme, including communication media, distribution modalities, and any other aspects of the programme, with the National Competent Authority.

The MAH shall ensure that in each Member State where Hulio is marketed, all healthcare professionals who are expected to prescribe Hulio are provided with the following educational package:

- Physician educational material
- Patient information

**The physician educational material** should contain:

- The Summary of Product Characteristics
- Guide for healthcare professionals
- Patient alert card

**The Guide for healthcare professionals** shall contain the following key elements:

- Relevant information on the safety concerns of serious infections, sepsis, tuberculosis and opportunistic infections; congestive heart failure; demyelinating disorders; malignancies to be addressed by the additional risk minimisation measures (e.g. seriousness, severity, frequency, time to onset, reversibility of the AE as applicable).

**The patient alert card** shall contain the following key messages:

- A warning message for HCPs treating the patient at any time, including in conditions of emergency, that the patient is using Hulio.
- That Hulio treatment may increase the potential risks of serious infections, sepsis, tuberculosis and opportunistic infections; congestive heart failure; demyelinating disorders; malignancies.
- Signs or symptoms of the safety concern and when to seek attention from a HCP
- Contact details of the prescriber

**The patient information pack** should contain:

- Patient information leaflet

This card contains select important safety information that you need to know before and during your child’s treatment with Hulio.

- Keep this card with you/your child at all times and for 4 months after his/her last injection of Hulio.
- Show this card to any doctor or healthcare professional that your child sees.
- Record information about any tuberculosis tests or treatment your child has had on the inside of this card.

For detailed information about Hulio, read the Package Leaflet which is included in the Hulio package, or talk with your child’s doctor, nurse or pharmacist.

1. Introduction

Hulio helps people with certain inflammatory diseases. It does this by blocking a part of the immune system which helps fight infection.

While Hulio can be effective in treating these inflammatory diseases, some people can experience one or more side effects. It is important to talk to your child’s doctor about the possible benefits and possible side effects of giving your child Hulio.

Please read the Hulio package leaflet for a full list of possible side effects your child could experience with Hulio treatment.

2. Before Hulio Treatment

Tell your child’s doctor about any existing health problems your child has and any medicines he/she is already taking. This will help you and your child’s doctor decide if Hulio is right for your child.

Tell your child’s doctor if your child:

- has an infection or has symptoms of an infection (such as fever, wounds, feeling tired, dental problems);
- has, or has previously had, tuberculosis or has been in close contact with someone with tuberculosis;
- has, or has previously had, a serious heart condition or heart failure;
- has, or has previously had, cancer;
- has any numbness or tingling or has a problem that affects his/her nervous system, such as multiple sclerosis.

Your child’s doctor should check your child for signs and symptoms of tuberculosis before starting Hulio. Your child may need to be treated for tuberculosis before you give them Hulio.

3. During Hulio Treatment

To make sure that Hulio is working properly and safely for your child, you should meet with your child’s doctor regularly to discuss how your child is. Tell your child’s doctor straight away about any
changes in his/her condition.

**It is important to tell your child’s doctor straight away about any unusual symptoms or side effects your child may experience.** This will help make sure your child gets the right care. It will also lower the chance of a side effect becoming worse.

If your child gets a side effect, your child’s doctor will decide if he/she should continue or stop their Hulio treatment.

Since side effects can still develop after your child’s last dose of Hulio, **tell your child’s doctor about any symptoms that he/she may have up to 4 months after his/her last injection of Hulio.**

Tell your child’s doctor about:
- any new medical conditions that your child develops;
- new medicines your child starts taking,
- any surgery or operation that your child has planned.

4. **Side Effects**

Please read the Hulio package leaflet for a full list of possible side effects.

If your child gets any side effects, talk to your child’s doctor, pharmacist or nurse. This includes any possible side effects not listed in the Package Leaflet.

**Seek urgent medical attention if your child experiences any of the following symptoms as they may indicate a serious side effect of Hulio treatment:**
- severe rash, hives or other signs of allergic reaction;
- swollen face, hands or feet;
- trouble breathing or swallowing;
- pale complexion, dizziness, persistent fever, bruising or bleeding very easily.

Some of the other important side effects that your child could develop include:
- **Infections:** Hulio can make your child more likely to get infections or make any infection that your child may have worse. This includes infections such as colds or more serious infections like tuberculosis.
- **Heart failure:** Hulio can cause your child to develop heart failure or cause worsening of heart failure your child may already have.
- **Cancer:** Hulio can increase the risk of getting certain types of cancer.
- **Nervous system problems:** Hulio can cause your child to develop new or worsening nervous system problems. Symptoms your child could develop can include vision change, muscle weakness or unexpected dizziness.

Speak to your child’s doctor if you suspect your child is suffering from any of the above (see Package Leaflet for symptoms to look out for).

By reporting side effects you can help provide more information on the safety of this medicine. See Package Leaflet for more details.
5. Information for you and healthcare professionals involved in your child’s medical care or treatment

Your child’s name:___________________________________________________________

Hulio

Patient Alert Card – for use in adults

This card contains select important safety information that you need to know before and during your treatment with Hulio.

- Keep this card with you at all times and for 4 months after your last injection of Hulio.
- Show this card to any doctor or healthcare professional that you see.
- Record information about any tuberculosis tests or treatment you have had on the inside of this card.

For detailed information about Hulio, read the Package Leaflet which is included in the Hulio package, or talk with your doctor, nurse or pharmacist.

1. Introduction

Hulio helps people with certain inflammatory diseases. It does this by blocking a part of the immune system which helps fight infection.

While Hulio can be effective in treating these inflammatory diseases, some people can experience one or more side effects. It is important to talk to your doctor about the possible benefits and possible side effects of taking Hulio.

Please read the Hulio package leaflet for a full list of possible side effects you could experience with Hulio treatment.

2. Before Hulio Treatment

Tell your doctor about any existing health problems you have and any medicines you are already taking. This will help you and your doctor decide if Hulio is right for you.

Tell your doctor if you:
- have an infection or have symptoms of an infection (such as fever, wounds, feeling tired, dental problems);
- have, or have previously had, tuberculosis or have been in close contact with someone with tuberculosis;
- have, or have previously had, a serious heart condition or heart failure;
- have, or have previously had, cancer;
- have any numbness or tingling or have a problem that affects your nervous system, such as multiple sclerosis.

Your doctor should also check you for signs and symptoms of tuberculosis before starting Hulio. You may need to be treated for tuberculosis before you start Hulio.

3. During Hulio Treatment

To make sure that Hulio is working properly and safely for you, you should meet with your doctor regularly to discuss how you are. Tell your doctor straight away about any changes in your condition.

It is important to tell your doctor straight away about any unusual symptoms or side effects you may experience. This will help make sure you get the right care. It will also lower the chance of a
side effect becoming worse.

If you get a side effect, your doctor will decide if you should continue or stop your Hulio treatment.

Since side effects can still develop after your last dose of Hulio, tell your doctor about any symptoms that you may have up to 4 months after your last injection of Hulio.

Tell your doctor about:
- any new medical conditions that you develop;
- new medicines you start taking;
- any surgery or operation that you have planned.

4. Side Effects

Please read the Hulio package leaflet for a full list of possible side effects.

If you get any side effects, talk to your doctor, pharmacist or nurse. This includes any possible side effects not listed in the Package Leaflet.

Seek urgent medical attention if you experience any of the following symptoms as they may indicate a serious side effect of Hulio treatment:
- severe rash, hives or other signs of allergic reaction;
- swollen face, hands or feet;
- trouble breathing or swallowing;
- pale complexion, dizziness, persistent fever, bruising or bleeding very easily.

Some of the other important side effects that you could develop include:
- **Infections:** Hulio can make you more likely to get infections or make any infection that you may have worse. This includes infections such as colds or more serious infections like tuberculosis.
- **Heart failure:** Hulio can cause you to develop heart failure or cause worsening of heart failure you already have.
- **Cancer:** Hulio can increase the risk of getting certain types of cancer.
- **Nervous system problems:** Hulio can cause you to develop new or worsening nervous system problems. Symptoms you might develop can include vision changes, muscle weakness, or unexpected dizziness.

Speak to your doctor if you suspect you are suffering from any of the above (see Package Leaflet for symptoms to look out for)

By reporting side effects you can help provide more information on the safety of this medicine. See Package Leaflet for more details.
5. **Information for you and healthcare professionals involved in your medical care or treatment**

Your name: ____________________________________________________________

Doctor’s name (who prescribed Hulio): __________________________________

Doctor’s phone number: ________________________________________________

Indication: ____________________________________________________________

Date of your first Hulio injection: ________________________________________

Dose of your Hulio injection: __________________________________________

Date of your last Hulio injection (if no longer taking Hulio): ________________

**Tuberculosis (TB) Tests and Treatment**

Mark this box if you have ever **been tested for TB**:  
☐ YES (Check with your doctor if you do not know)

Mark this box if you have ever **had any test that was positive for TB**:  
☐ YES (Check with your doctor if you do not know)

Mark this box if you have ever **taken any pills to treat or prevent TB**:  
☐ YES (Check with your doctor if you do not know)

**Please read the Hulio Package Leaflet for more information.** If you have any other questions, talk to your doctor or another healthcare professional.

B. PACKAGE LEAFLET
This medicine is subject to additional monitoring. This will allow quick identification of new safety information. You can help by reporting any side effects you may get. See the end of section 4 for how to report side effects.

Read all of this leaflet carefully before giving your child this medicine because it contains important information for him/her.
- Keep this leaflet. You may need to read it again.
- Your doctor will also give you a Patient Alert Card, which contains important safety information that you need to be aware of before your child is given Hulio and during treatment with Hulio. Keep this Patient Alert Card with you or your child at all times and for 4 months after your child’s last injection of Hulio.
- If you have any further questions, ask your doctor or pharmacist.
- This medicine has been prescribed for your child only. Do not pass it on to others. It may harm them, even if their signs of illness are the same as your child's.
- If your child gets any side effects, talk to your child’s doctor or pharmacist. This includes any possible side effects not listed in this leaflet. See section 4.

What is in this leaflet
1. What Hulio is and what it is used for
2. What you need to know before giving your child Hulio
3. How to use Hulio
4. Possible side effects
5. How to store Hulio
6. Contents of the pack and other information
7. Instructions for use

1. What Hulio is and what it is used for

Hulio contains the active substance adalimumab, a medicine that acts on your body’s immune (defence) system.

Hulio is intended for the treatment of the following inflammatory diseases:

- polyarticular juvenile idiopathic arthritis in children aged 2-17 years;
- enthesitis-related arthritis in children aged 6-17 years;
- Crohn’s disease in children aged 6-17 years
- plaque psoriasis in children aged 4-17 years;
- hidradenitis suppurativa in adolescents aged 12-17 years;
- chronic non-infectious uveitis in children aged 2-17 years affecting the front of the eye.

The active ingredient in Hulio, adalimumab, is a monoclonal antibody. Monoclonal antibodies are proteins that attach to specific target in the body. The target of adalimumab is another protein called tumour necrosis factor (TNFα), which is present at increased levels in the inflammatory diseases listed above. By attaching to TNFα, Hulio decreases the process of inflammation in these diseases.

Polyarticular juvenile idiopathic arthritis and enthesitis-related arthritis

Polyarticular juvenile idiopathic arthritis and enthesitis-related arthritis are inflammatory diseases of the joints that usually first appear in childhood.
Hulio is used to treat polyarticular juvenile idiopathic arthritis in children and adolescents aged 2 to 17 years, and enthesitis-related arthritis in children and adolescents aged 6 to 17 years. Patients may first be given other disease-modifying medicines, such as methotrexate. If these medicines do not work well enough, patients will be given Hulio to treat their polyarticular juvenile idiopathic arthritis or enthesitis-related arthritis.

**Paediatric Crohn’s disease**

Crohn’s disease is an inflammatory disease of the gut.

Hulio is used to treat Crohn’s disease in children aged 6 to 17 years. Patients will first be given other medicines. If these medicines do not work well enough patients will be given Hulio to reduce the signs and symptoms of your Crohn’s disease.

**Paediatric plaque psoriasis**

Plaque psoriasis is an inflammatory skin condition that causes red, flaky, crusty patches of skin covered with silvery scales. Plaque psoriasis can also affect the nails, causing them to crumble, become thickened and lift away from the nail bed which can be painful. Psoriasis is believed to be caused by a problem with the body’s immune system that leads to an increased production of skin cells.

Hulio is used to treat severe plaque psoriasis in children and adolescents aged 4 to 17 years whom medicines applied to the skin and treatment with UV light have either not worked very well or are not suitable.

**Adolescent hidradenitis suppurativa**

Hidradenitis suppurativa (sometimes called ‘acne inversa’) is a long-term and often painful inflammatory skin disease. Symptoms may include tender nodules (lumps) and abscesses (boils) that may leak pus. It most commonly affects specific areas of the skin, such as under the breasts, the armpits, inner thighs, groin and buttocks. Scarring may also occur in affected areas.

Hulio is used to treat hidradenitis suppurativa in adolescents from 12 years of age. Hulio can reduce the number of nodules and abscesses you have, and the pain that is often associated with the disease. Patients may first be given other medicines. If these medicines do not work well enough, patients will be given Hulio.

**Chronic non-infectious uveitis affecting the front of the eye**

Non-infectious uveitis is an inflammatory disease affecting certain parts of the eye. This inflammation leads to a decrease of vision and/or the presence of floaters in the eye (black dots or wispy lines that move across the field of vision). Hulio works by reducing this inflammation.

Hulio is used to treat children and adolescents aged 2 to 17 years with chronic non-infectious uveitis who have inflammation affecting the front of the eye.

2. **What you need to know before giving your child Hulio**

**Do not give Hulio**

- If your child is allergic to adalimumab or any of the other ingredients of this medicine (listed in section 6).
- If your child has a severe infection, including tuberculosis (see “Warnings and precautions”). It is important that you tell your doctor if your child has symptoms of infections, e.g. fever, wounds, feeling tired, dental problems.
If your child has moderate or severe heart failure. It is important to tell your doctor if your child has had or have a serious heart condition (see “Warnings and precautions”).

Warnings and precautions

Talk to your doctor or pharmacist before using Hulio.

Allergic Reaction

If your child has allergic reactions with symptoms such as chest tightness, wheezing, dizziness, swelling or a rash do not inject them more Hulio and contact their doctor immediately since, in rare cases, these reactions can be life-threatening.

Infections
• If your child have an infection, including long-term or localised infection (for example, leg ulcer) consult your child’s doctor before starting Hulio. If you are unsure, contact your child’s doctor.
• Your child might get infections more easily while he/she is receiving Hulio treatment. This risk may increase if your child lung function is reduced. These infections may be serious and include tuberculosis, infections caused by viruses, fungi, parasites or bacteria, or other unusual infectious organisms and sepsis (blood poisoning). In rare cases, these infections may be life-threatening. It is important to tell your child’s doctor if your child gets symptoms such as fever, wounds, feeling tired or dental problems. Your child’s doctor may recommend temporarily stopping Hulio.

Tuberculosis (TB)
• As cases of tuberculosis have been reported in patients treated with adalimumab, your child’s doctor will check your child for signs and symptoms of tuberculosis before starting Hulio. This will include a thorough medical evaluation including your medical history and screening tests (for example chest X-ray and a tuberculin test). The conduct and results of these tests should be recorded on child’s patient alert card. It is very important that you tell your child’s doctor if he/she have ever had tuberculosis, or if he/she have been in close contact with someone who has had tuberculosis. Tuberculosis can develop during therapy even if your child have had preventative treatment for tuberculosis. If symptoms of tuberculosis (persistent cough, weight loss, listlessness, mild fever), or any other infection appear during or after therapy tell your child’s doctor immediately.

Travel/recurrent infection
• Tell your child’s doctor if you reside or travel in regions where fungal infections such as histoplasmosis, coccidioidomycosis or blastomycosis are common.
• Tell your child’s doctor if you have a history of recurrent infections or other conditions that increase the risk of infections.

Hepatitis B virus
• Tell your child’s doctor if your child is a carrier of the hepatitis B virus (HBV), if he/she has active HBV infection or if you think he/she might be at risk of contracting HBV. Your child’s doctor will test your child for HBV. Hulio can reactivate HBV infection in people who carry this virus. In some rare cases, especially if your child is taking other medicines that suppress the immune system, reactivation of HBV infection can be life-threatening.
Surgery or dental procedure

- If your child is about to have surgery or dental procedures, tell your child’s doctor that your child is taking Hulio. Their doctor may recommend temporarily stopping Hulio.

Demyelinating disease

- If your child has or develops demyelinating disease (a disease that affects the insulating layer around the nerves), such as multiple sclerosis, your child’s doctor will decide if he/she should receive or continue to receive Hulio. Tell your child’s doctor immediately if your child gets symptoms like changes in vision, weakness in arms or legs or numbness or tingling in any part of the body.

Vaccine

- Certain vaccines contain living but weakened forms of bacteria or viruses that cause diseases and should not be given during treatment with Hulio in case they cause infections. Check with child’s doctor before receiving any vaccines. It is recommended that, if possible, children be given all the scheduled vaccinations for their age before they start treatment with Hulio. If your child received Hulio while pregnant, your child’s baby may be at higher risk for getting an infection for up to about five months after the last dose she received during her pregnancy. It is important that you tell the baby's doctors and other health care professionals about Hulio use during your child’s pregnancy so they can decide when your child’s baby should receive any vaccine.

Heart Failure

- It is important to tell your child’s doctor if your child had or have a serious heart condition. If your child has mild heart failure and are being treated with Hulio, your child’s heart failure status must be closely monitored by the doctor. If your child develops new or worsening symptoms of heart failure (e.g. shortness of breath, or swelling of feet), you must contact your child’s doctor immediately.

Fever, bruising, bleeding or looking pale

- In some patients the body may fail to produce enough of the blood cells that fight infections or help you to stop bleeding. If your child develops a fever that does not go away, or bruises or bleeds very easily or look very pale, call your child’s doctor right away. Your child’s doctor may decide to stop treatment.

Cancer

- There have been very rare cases of certain kinds of cancer in children and adults taking adalimumab or other TNFα blockers. People with more serious rheumatoid arthritis who have had the disease for a long time may have a higher than average risk of getting lymphoma and leukaemia (cancers that affect blood cells and bone marrow). If your child takes Hulio the risk of getting lymphoma, leukaemia, or other cancers may increase. On rare occasions, a specific and severe type of lymphoma has been observed in some patients taking adalimumab. Some of those patients were also treated with the medicines azathioprine or mercaptopurine. Tell your child’s doctor if your child is taking azathioprine or mercaptopurine with Hulio.
- In addition cases of non-melanoma skin cancer have been observed in patients taking adalimumab. If new areas of damaged skin appear during or after treatment or if existing marks or areas of damage change appearance, tell your child’s doctor.
- There have been cases of cancers, other than lymphoma, have been reported in patients with a specific type of lung disease called chronic obstructive pulmonary disease (COPD) treated with another TNFα blocker. If your child has COPD, or is a heavy smoker, you should discuss with your child’s doctor whether treatment with a TNFα blocker is appropriate for your child.
Other medicines and Hulio

Tell your child’s doctor or pharmacist if your child is taking, has recently taken or might take any other medicines.

Hulio can be taken together with methotrexate or certain disease-modifying anti-rheumatic agents (sulfasalazine, hydroxychloroquine, leflunomide and injectable gold preparations), corticosteroids or pain medications including non-steroidal anti-inflammatory drugs (NSAIDs).

Your child should not take Hulio with medicines containing the active substances anakinra or abatacept. The combination of Hulio and anakinra or abatacept is not recommended based upon the possible increased risk for infections, including serious infections and other potential pharmacological interactions. If you have questions, please ask your child’s doctor.

Pregnancy and breast-feeding

- Your child should consider the use of adequate contraception to prevent pregnancy and continue its use for at least 5 months after their last Hulio injection.
- If your child is pregnant, thinks she may be pregnant or is planning to have a baby, ask her doctor for advice about taking this medicine.
- Hulio should only be used during a pregnancy if needed.
- According to a pregnancy study, there was no higher risk of birth defects when the mother had received Hulio during pregnancy compared with mothers with the same disease who did not receive Hulio.
- Hulio can be used during breast-feeding.
- If your child receives Hulio during her pregnancy, her baby may have a higher risk for getting an infection.
- It is important that you tell her baby’s doctors and other health care professionals about her Hulio’s use during her pregnancy before the baby receives any vaccine. For more information on vaccines, see “Warnings and precautions” section.

Driving and using machines

Hulio may have a minor influence on your ability to drive, cycle or use machines. Room spinning sensation (vertigo) and vision disturbances may occur after taking Hulio.

Hulio contains sodium and sorbitol

Each Hulio vial contains 38.2 mg of sorbitol. Sorbitol is a source of fructose. If your child’s doctor has told you that your child has an intolerance to some sugars or if your child has been diagnosed with hereditary fructose intolerance (HFI), a rare genetic disorder in which a person cannot break down fructose, talk to your child’s doctor before you give your child this medicine.

Also this medicine contains less than 1 mmol of sodium (23 mg) per vial, that is to say essentially ‘sodium-free’.

3. How to use Hulio

Always use this medicine exactly as your child’s doctor or pharmacist has instructed. Check with your child’s doctor or pharmacist if you are not sure about any of the instructions or if you have any questions. Your doctor may prescribe another strength of Hulio if your child needs a different dose.
Children and adolescents with polyarticular juvenile idiopathic arthritis

Children and adolescents from 2 to 17 years of age weighing 10 kg to less than 30 kg:
The recommended dose of Hulio is 20 mg every other week.

Children and adolescents from 2 to 17 years of age weighing 30 kg or more:
The recommended dose of Hulio is 40 mg every other week.

Children and adolescents with enthesitis-related arthritis

Children and adolescents from 6 to 17 years of age weighing 15 kg to less than 30 kg:
The recommended dose of Hulio is 20 mg every other week.

Children and adolescents from 6 to 17 years of age weighing 30 kg or more:
The recommended dose of Hulio is 40 mg every other week.

Children and adolescents with Crohn’s disease

Children and adolescents from 6 to 17 years of age weighing less than 40 kg:
The usual dose regimen is 40 mg adalimumab initially, followed by 20 mg two weeks later. If a faster response is required, your child’s doctor may prescribe an initial dose of 80 mg (as two 40 mg injections in one day) followed by 40 mg two weeks later.

Thereafter, the usual dose is 20 mg every other week. If this dose does not work well enough, your child’s doctor may increase the dose frequency to 20 mg every week.

Children and adolescents from 6 to 17 years of age weighing 40 kg or more:
The usual dose regimen is 80 mg initially (as two 40 mg injections in one day), followed by 40 mg two weeks later. If a faster response is required, your child’s doctor may prescribe an initial dose of 160 mg initially (as four 40 mg injections in one day or two 40 mg injections per day for two consecutive days) followed by 80 mg (as two 40 mg injections in one day) two weeks later.

Thereafter, the usual dose is 40 mg every other week. If this dose does not work well enough, your child’s doctor may increase the dosage to 40 mg every week or 80 mg every other week.

Children or adolescents with plaque psoriasis

Children and adolescents from 4 to 17 years of age weighing 15 kg to less than 30 kg:
The recommended dose of Hulio is an initial dose of 20 mg, followed by 20 mg one week later. Thereafter the usual dose is 20 mg every other week.

Children and adolescents from 4 to 17 years of age weighing 30 kg or more:
The recommended dose of Hulio is an initial dose of 40 mg, followed by 40 mg one week later. Thereafter the usual dose is 40 mg every other week.

Adolescents with hidradenitis suppurativa (from 12 to 17 years of age, weighing at least 30 kg)

The recommended dose of Hulio is an initial dose of 80 mg (as two 40 mg injections in one day), followed by 40 mg every other week starting one week later. If this dose does not work well enough, then your child’s doctor may increase this to 40 mg every week or 80 mg every other week.

It is recommended that your child uses an antiseptic wash daily on the affected areas during treatment with Hulio.
**Children and adolescents with chronic non-infectious uveitis**

*Children and adolescents from 2 to 17 years of age weighing less than 30 kg:*

The usual dose of Hulio is 20 mg every other week with methotrexate.

Your child’s doctor may also prescribe an initial dose of 40 mg which may be administered one week prior to the start of the usual recommended dose.

*Children and adolescents from 2 to 17 years of age weighing 30 kg or more:*

The usual dose of Hulio is 40 mg every other week with methotrexate.

Your child’s doctor may also prescribe an initial dose of 80 mg which may be administered one week prior to the start of the usual dose.

For patients who are prescribed a full 40 mg dose of Hulio, a 40 mg pre-filled pen and a 40 mg pre-filled syringe are also available from your pharmacist.

**Method and route of administration**

Hulio is administered by injection under the skin (subcutaneous use).

Detailed instructions on how to inject Hulio are provided in Section 7 - Instructions for use.

**If you use more Hulio than you should**

If you accidentally inject your child Hulio more frequently than you should, call your child’s doctor or pharmacist and explain that your child has been given more than required. Always take the outer carton or the medicine with you, even if it is empty.

**If you forget to use Hulio**

If you forget to give your child an injection, you should inject the next dose of Hulio as soon as you remember. Then give your child’s next dose as you would have on your originally scheduled day, had you not forgotten a dose.

**If your child stops using Hulio**

The decision to stop using Hulio should be discussed with your child’s doctor. Your child’s symptoms may return upon stopping treatment.

If you have any further questions on the use of this medicine, ask your child’s doctor or pharmacist.

4. **Possible side effects**

Like all medicines, this medicine can cause side effects, although not everybody gets them. Most side effects are mild to moderate. However, some may be serious and require urgent medical treatment.

Side effects may occur up to 4 months or more after the last Hulio injection.

**Seek medical attention urgently** if your child develops any of the following signs of allergic reaction or heart failure:
- severe rash, hives
- swollen face, hands or feet;
- trouble breathing or swallowing;
- pale complexion, dizziness, persistent fever, bruising or bleeding very easily.
Tell your doctor as soon as possible, if you notice any of the following:

- signs and symptoms of infection such as fever, feeling sick, wounds, dental problems, burning on urination, feeling weak or tired or coughing;
- symptoms of nerve problems such as tingling, numbness, double vision or arm or leg weakness;
- signs of skin cancer such as a bump or open sore that doesn't heal;
- signs and symptoms suggestive of blood disorders such as persistent fever, bruising, bleeding, paleness.

The following side effects have been observed with adalimumab:

**Very common** (may affect more than 1 in 10 people):
- injection site reactions (including pain, swelling, redness or itching);
- respiratory tract infections (including cold, runny nose, sinus infection, throat infection, pneumonia);
- abnormal blood results;
- headache;
- abdominal (belly) pain;
- nausea and vomiting;
- pain in bone and muscles.

**Common** (may affect up to 1 in 10 people):
- any infection (including tuberculosis, blood poisoning, influenza, cellulitis, shingles,
  ear infections, tooth infections, cold sores, reproductive tract infections, urinary tract infection, fungal infections, joint infections);
- benign tumours;
- skin cancer;
- mild allergic reactions (including seasonal allergy);
- dehydration;
- mood swings (including depression);
- anxiety;
- difficulty sleeping;
- sensation disorders such as tingling, prickling or numbness;
- migraine;
- neck or back pain;
- vision disturbances;
- eye/eyelid inflammation or swelling;
- vertigo (sensation of the room spinning);
- cough;
- sensation of heart beating rapidly;
- high blood pressure;
- skin flushing;
- blood clot;
- asthma;
- bleeding in the stomach;
- indigestion, bloating, heart burn;
- acidity/acid reflux;
- dry eyes, dry mouth;
- itching, inflammation of the skin (including eczema);
- increased sweating;
- hair loss;
- new or worsening psoriasis (red, flaky skin);
- muscle spasms;
- blood in urine;
• kidney problems;
• slow healing of wounds.

Uncommon (may affect up to 1 in 100 people):
• cancer of the lymph system (lymphoma);
• immune disorders that could affect the lungs, skin and lymph nodes (most commonly as a condition called sarcoidosis);
• inflammation of blood vessels;
• tremor;
• nerve damage;
• stroke;
• double vision;
• hearing loss, buzzing;
• irregular heart beat;
• lung diseases causing shortness of breath (including inflammation);
• blockage in an artery of the lung;
• excessive fluid around the lung;
• inflammation of the pancreas;
• difficulty in swallowing;
• gallbladder inflammation, gallbladder stones;
• fatty liver (build-up of fat in liver cells);
• night sweats;
• scarring;
• abnormal muscle breakdown;
• systemic lupus erythematous (including inflammation of skin, heart, lung, joints and other organ systems);
• excessive night urination;
• impotence.

Rare (may affect up to 1 in 1,000 people):
• leukaemia (cancer affecting the blood and bone marrow);
• multiple sclerosis;
• nerve disorders (such as inflammation of the optic nerve to the eye, and Guillain-Barré syndrome, a condition that may cause muscle weakness, abnormal sensations, tingling in the arms and upper body);
• heart attack;
• pulmonary fibrosis (scarring of the lung);
• hole/tear in the intestine;
• inflammation of the liver;
• inflammation of blood vessels in the skin;
• Stevens-Johnson syndrome;
• inflammatory skin rash;
• lupus-like syndrome.

Not known (frequency cannot be estimated from available data):
• hepatosplenic T-cell lymphoma (a rare blood cancer);
• Merkel cell carcinoma (a type of skin cancer);
• liver failure;
• worsening skin rash with muscle weakness.

Reporting of side effects

If your child gets any side effects, talk to your child’s doctor or pharmacist. This includes any possible side effects not listed in this leaflet.
You can also report side effects directly via the national reporting system listed in Appendix V. By reporting side effects you can help provide more information on the safety of this medicine.

5. How to store Hulio

Keep this medicine out of the sight and reach of children.

Do not use this medicine after the expiry date which is stated on the label/carton after EXP. The expiry date refers to the last day of that month.

Store in a refrigerator (2°C – 8°C). Do not freeze.

Keep the vial in the outer carton in order to protect from light.

Do not throw away any medicines via wastewater or household waste. Ask your pharmacist how to throw away medicines you no longer use. These measures will help protect the environment.

6. Contents of the pack and other information

What Hulio contains
- The active substance is adalimumab
- The other ingredients are monosodium glutamate, sorbitol, methionine, polysorbate 80, hydrochloric acid and water for injections.

What Hulio looks like and contents of the pack

Hulio 40 mg solution for injection (injection) in vials is supplied as a sterile solution of 40 mg adalimumab dissolved in 0.8 ml clear or slightly opalescent, colourless to pale brownish-yellow solution.

The Hulio vial is a glass vial with a rubber stopper. Hulio is supplied as packs containing 2 boxes. Each box contains 1 vial, 1 sterile injection syringe, 1 sterile needle, 1 sterile vial adapter and 2 alcohol pads.

Hulio is also available as a pre-filled syringe or a pre-filled pen.

Detailed information on this medicine is available on the European Medicines Agency web site:

7. Instructions for use

Read the instructions carefully and follow them step by step. Your child’s doctor, nurse or other healthcare professional will show you how to prepare the injection and give it to your child. They will also tell you the prescribed amount (volume).

Do not attempt to give your child an injection until you are sure that you understand how to do this. After proper training, the injection can be self-administered or given by another person, for example a family member or carer.

Each vial contains one 40 mg dose of adalimumab.

Do not mix any other medicine into the same syringe or vial with the Hulio solution.

To help you remember which day(s) Hulio should be injected, it may be helpful to make a note on a calendar or in a diary.

Before you start

Make sure you know the prescribed amount. If you don’t know this, STOP HERE and ask your child’s doctor.

Find a quiet area with a well-lit, clean and flat work surface and gather all the supplies you will need to give the injection.

Supplies you will need:
- 1 box of Hulio vial for paediatric use
- 1 sharps disposal container (not included in Hulio pack)
- 1 gauze pad or cotton ball (not included in Hulio pack)

If you do not have all the supplies you need, ask your nurse or pharmacist.
Preparing the Hulio injection

Each Hulio single vial box will contain:
- 1 syringe (1)
- 1 vial adapter (2)
- 1 vial of Hulio solution (3)
- 2 alcohol pads (4)
- 1 needle (5)

Hulio packs should be stored in the fridge (between 2 to 8°C) until needed for use.
- Take a single vial box out of the fridge at least 30 minutes before you intend to use it to allow the contents to reach room temperature. If there is a second box in the Hulio pack for a future injection, place it back in the refrigerator immediately.
  - DO NOT use other heat sources such as a microwave oven or hot water to warm the vial.
  - DO NOT put the vial back in the fridge after it has reached room temperature.
- Check the expiry date printed on the vial.
  - DO NOT use the vial if past the expiry date.
- Check the solution in the vial is clear, colourless and has no particles.
  - DO NOT use the vial if the solution is cloudy, discoloured, or has particles in it.

Injection steps

Follow the steps below carefully each time you inject Hulio:

**Step 1 - Choose and prepare injection site**

Hulio is for subcutaneous injection. It should be injected into the thigh or abdomen.

You should rotate and change the injection site each time, staying at least 3 cm from the previous site used.

If you are injecting into the abdomen, choose a site that is at least 5 cm away from the belly button.

- DO NOT inject into skin that is red, hard, bruised, or tender.
- DO NOT inject into scars or stretch marks.
- If your child has psoriasis, DO NOT inject into any raised, thick, red, or scaly skin patches, or lesions.
- DO NOT inject through clothes. Roll back any clothing that may interfere with the injection site.

**Step 2 - Wash hands**

Wash your hands thoroughly with soap and water.

**Preparing the Hulio dose for injection**

**Step 3 – Partially open syringe and needle packaging**

Partially peel open the syringe package from the end closest to the white plunger rod. Peel the clear plastic just far enough to expose the white plunger rod, but DO NOT take the syringe out of the package.

Partially peel open the needle package from the end closest to the yellow syringe connector. Peel the clear plastic just far enough to expose the yellow connector, but DO NOT take the needle out of the package.
### Step 4 - Uncap vial and wipe vial stopper

Pop off the white plastic cap from the vial to expose the vial stopper.

Use one of the alcohol pads to wipe the stopper and then place the vial on a flat surface.

- **DO NOT** touch the vial stopper after wiping with the alcohol pad.

### Step 5 - Attach vial adapter to vial

Peel the cover off the vial adapter package but **DO NOT** take the adapter out of the package.

With the vial adapter still in the clear package, attach it to the vial stopper by pushing the adapter over the vial until it snaps in place.

When you are sure the adapter is attached to the vial, lift off the packaging.

Gently set the connected vial and adapter down on a flat work surface. Be careful that it does not fall over.

### Step 6 - Pull plunger to dose + 0.1 ml

Hold the syringe package and SLOWLY pull the white plunger to 0.1 ml beyond the prescribed dose (for example, if the prescribed dose is 0.5 ml, pull the white plunger rod to 0.6 ml).

**DO NOT** pull the white plunger rod completely out of the syringe.

- **If the white plunger rod is pulled out of the syringe, discard the syringe and contact your Hulio provider for a replacement. DO NOT** try to reinsert the white plunger rod.

### Step 7 - Attach syringe to vial adapter and push plunger rod

Hold the syringe on the graduated area and remove it from the packaging.

- **DO NOT** hold the syringe by the white plunger rod.

Insert the syringe tip into the vial adapter and twist it clockwise until firmly attached.

- **DO NOT** over-tighten.

Push the plunger rod all the way down. This step is important to get the proper dose.
Step 8 - Pull plunger to draw dose + 0.1 ml

Keep the plunger rod pressed down and turn the connected syringe and vial upside down.

SLOWLY pull the plunger rod to draw the Hulio solution into the syringe. Pull the plunger to 0.1 ml beyond the prescribed dose (for example, if the prescribed dose is 0.5 ml, pull the white plunger rod to 0.6 ml).

You will set the volume to the prescribed dose in a later step.

If there are air bubbles in the syringe, push the plunger rod all the way back in to push the solution back into the vial.

Repeat this step to draw the solution back into the syringe again, pulling the plunger rod SLOWLY.

If you see air bubbles in the solution again, you may repeat this step up to 3 times.

- DO NOT hold the syringe by the plunger rod.
- DO NOT shake the syringe.
- If the white plunger rod is pulled out of the syringe, discard the syringe and contact your Hulio provider for a replacement. DO NOT try to reinsert the white plunger rod.

Step 9 - Detach syringe from vial adapter and attach needle

Remove the vial adapter by twisting it off the syringe.

- DO NOT touch the top of the syringe.
- DO NOT hold the syringe by the white plunger rod.

Attach the needle to the syringe by inserting the syringe tip into the yellow syringe connector on the needle. Twist the syringe until the needle is firmly attached.

- Once syringe is firmly attached to the needle, remove the clear needle packaging.
## Dose Preparation

### Step 10 - Flip down pink needle cover and remove needle cap
Hold the syringe with the needle pointing up.
Flip down the pink needle cover and remove the needle cap by pulling it straight up. DO NOT twist the needle cap.

- DO NOT touch the needle.
- DO NOT put the needle cap back on the needle after it has been removed.

### Step 11 - Check and set prescribed dose
Hold the syringe at eye-level with the needle pointing up to see the amount of solution clearly.
Recheck the doctor’s prescription for the correct prescribed amount.
Push the plunger rod gently in until the syringe contains the prescribed amount. Excess solution may come out of the needle while pushing the plunger rod in. Be careful not to squirt the solution into your eye.
Gently place the syringe on a clean, flat surface.

- DO NOT wipe the needle or syringe.

## Injecting Hulio

### Step 12 - Prepare injection site
Wipe the skin at the chosen injection site with a new alcohol swab.
- Wait for the skin to dry on its own, do not blow it dry.
- DO NOT touch this area again before giving the injection.

### Step 13 - Squeeze injection site
Gently squeeze the cleaned area of skin and hold firmly.

At a 45° angle to the injection site, use a quick, short motion and push the needle all the way into skin.

### Step 14 - Push plunger to inject solution
Let go of the squeezed skin.
Push the white plunger rod to inject the Hulio solution until the syringe is empty.

### Step 15 - End of injection, remove syringe, engage needle cover
When the syringe is empty, remove syringe and needle from the skin.
After injection, if slight bleeding occurs from the injection site, lightly press a gauze or cotton ball against the site for a few seconds.

- DO NOT rub the injection site.
Gently flip the pink needle cover over the needle and snap into place. Set the syringe with covered needle on the work surface.

- DO NOT put the clear needle cap back on the needle.

**Throwing away supplies**

**Step 16 - Dispose syringe & needle**
Each vial, syringe, vial adapter and needle are for single-use only. These must NEVER be re-used.

Put the used syringe, needle, vial and vial adapter in a sharps disposal container after use.

- DO NOT throw the sharps container in your household bin.
- DO NOT recycle your used sharps disposal container.
- Always keep your sharps container out of the sight and reach of children.
- Throw away all other used items and empty packaging into your regular household waste.
Package leaflet: Information for the patient

Hulio 40 mg solution for injection in pre-filled syringe
adalimumab

This medicine is subject to additional monitoring. This will allow quick identification of new safety information. You can help by reporting any side effects you may get. See the end of section 4 for how to report side effects.

Read all of this leaflet carefully before you start using this medicine because it contains important information for you.
- Keep this leaflet. You may need to read it again.
- Your doctor will also give you a Patient Alert Card, which contains important safety information that you need to be aware of before you are given Hulio and during treatment with Hulio. Keep this Patient Alert Card with you at all times and for 4 months after your last injection of Hulio.
- If you have any further questions, ask your doctor or pharmacist.
- This medicine has been prescribed for you only. Do not pass it on to others. It may harm them, even if their signs of illness are the same as yours.
- If you get any side effects, talk to your doctor or pharmacist. This includes any possible side effects not listed in this leaflet. See section 4.

What is in this leaflet

1. What Hulio is and what it is used for
2. What you need to know before you use Hulio
3. How to use Hulio
4. Possible side effects
5. How to store Hulio
6. Contents of the pack and other information
7. Instructions for use

1. What Hulio is and what it is used for

Hulio contains the active substance adalimumab, a medicine that acts on your body’s immune (defence) system.

Hulio is intended for the treatment of the following inflammatory diseases:
- rheumatoid arthritis;
- polyarticular juvenile idiopathic arthritis;
- enthesitis-related arthritis;
- ankylosing spondylitis;
- axial spondyloarthritis without radiographic evidence of ankylosing spondylitis;
- psoriatic arthritis;
- psoriasis;
- hidradenitis suppurativa;
- Crohn’s disease;
- ulcerative colitis;
- non-infectious uveitis in adults and children.

The active ingredient in Hulio, adalimumab, is a monoclonal antibody. Monoclonal antibodies are proteins that attach to specific target in the body. The target of adalimumab is another protein called tumour necrosis factor (TNFα), which is present at increased levels in the inflammatory diseases listed above. By attaching to TNFα, Hulio decreases the process of inflammation in these diseases.
Rheumatoid arthritis

Rheumatoid arthritis is an inflammatory disease of the joints.

Hulio is used to treat rheumatoid arthritis in adults. If you have moderate to severe active rheumatoid arthritis, you may first be given other disease-modifying medicines, such as methotrexate. If these medicines do not work well enough, you will be given Hulio to treat your rheumatoid arthritis.

Hulio can also be used to treat severe, active and progressive rheumatoid arthritis without previous methotrexate treatment.

Hulio can slow down the damage to the cartilage and bone of the joints caused by the disease and improve physical function.

Usually, Hulio is used with methotrexate. If your doctor considers that methotrexate is inappropriate, Hulio can be given alone.

Polyarticular juvenile idiopathic arthritis and enthesitis-related arthritis

Polyarticular juvenile idiopathic arthritis and enthesitis-related arthritis are inflammatory diseases of the joints that usually first appear in childhood.

Hulio is used to treat polyarticular juvenile idiopathic arthritis in children and adolescents aged 2 to 17 years, and enthesitis-related arthritis in children and adolescents aged 6 to 17 years. Patients may first be given other disease-modifying medicines, such as methotrexate. If these medicines do not work well enough, patients will be given Hulio to treat their polyarticular juvenile idiopathic arthritis or enthesitis-related arthritis.

Ankylosing spondylitis and axial spondyloarthritis without radiographic evidence of ankylosing spondylitis

Ankylosing spondylitis and axial spondyloarthritis without radiographic evidence of ankylosing spondylitis are inflammatory diseases of the spine.

Hulio is used to treat ankylosing spondylitis and axial spondyloarthritis without radiographic evidence of ankylosing spondylitis in adults. If you have ankylosing spondylitis or axial spondyloarthritis without radiographic evidence of ankylosing spondylitis, you will first be given other medicines. If these medicines do not work well enough, you will be given Hulio to reduce the signs and symptoms of your disease.

Psoriatic arthritis

Psoriatic arthritis is an inflammatory disease of the joints associated with psoriasis.

Hulio is used to treat psoriatic arthritis in adults. Hulio can slow down the damage to the cartilage and bone of the joints caused by the disease and improve physical function.

Plaque psoriasis in adults and children

Plaque psoriasis is an inflammatory skin condition that causes red, flaky, crusty patches of skin covered with silvery scales. Plaque psoriasis can also affect the nails, causing them to crumble, become thickened and lift away from the nail bed which can be painful. Psoriasis is believed to be caused by a problem with the body’s immune system that leads to an increased production of skin cells.
Hulio is used to treat moderate to severe plaque psoriasis in adults. Hulio is also used to treat severe plaque psoriasis in children and adolescents aged 4 to 17 years whom medicines applied to the skin and treatment with UV light have either not worked very well or are not suitable.

**Hidradenitis suppurativa in adults and adolescents**

Hidradenitis suppurativa (sometimes called ‘acne inversa’) is a long-term and often painful inflammatory skin disease. Symptoms may include tender nodules (lumps) and abscesses (boils) that may leak pus. It most commonly affects specific areas of the skin, such as under the breasts, the armpits, inner thighs, groin and buttocks. Scarring may also occur in affected areas.

Hulio is used to treat hidradenitis suppurativa in adults, and adolescents from 12 years of age. Hulio can reduce the number of nodules and abscesses you have, and the pain that is often associated with the disease. You may first be given other medicines. If these medicines do not work well enough, you will be given Hulio.

**Crohn’s disease in adults and children**

Crohn’s disease is an inflammatory disease of the gut.

Hulio is used to treat Crohn’s disease in adults, and children aged 6 to 17 years. If you have Crohn’s disease you will first be given other medicines. If you do not respond well enough to these medicines, you will be given Hulio to reduce the signs and symptoms of your Crohn’s disease.

**Ulcerative colitis**

Ulcerative colitis is an inflammatory disease of the bowel.

Hulio is used to treat ulcerative colitis in adults. If you have ulcerative colitis you will first be given other medicines. If these medicines do not work well enough, you will be given Hulio to reduce the signs and symptoms of your disease.

**Non-infectious uveitis in adults and children**

Non-infectious uveitis is an inflammatory disease affecting certain parts of the eye. This inflammation leads to a decrease of vision and/or the presence of floaters in the eye (black dots or wispy lines that move across the field of vision). Hulio works by reducing this inflammation.

Hulio is used to treat:
- adults with non-infectious uveitis with inflammation affecting the back of the eye.
- children and adolescents aged 2 to 17 years with chronic non-infectious uveitis who have inflammation affecting the front of the eye.

**2. What you need to know before you use Hulio**

**Do not use Hulio**

- If you are allergic to adalimumab or any of the other ingredients of this medicine (listed in section 6).
- If you have a severe infection, including tuberculosis (see “Warnings and precautions”). It is important that you tell your doctor if you have symptoms of infections, e.g. fever, wounds, feeling tired, dental problems.
- If you have moderate or severe heart failure. It is important to tell your doctor if you have had or have a serious heart condition (see “Warnings and precautions”).
Warnings and precautions

Talk to your doctor or pharmacist before using Hulio.

Allergic Reaction

If you have allergic reactions with symptoms such as chest tightness, wheezing, dizziness, swelling or a rash, do not inject more Hulio and contact your doctor immediately since, in rare cases, these reactions can be life-threatening.

Infections

- If you have an infection, including long-term or localised infection (for example, leg ulcer) consult your doctor before starting Hulio. If you are unsure, contact your doctor.
- You might get infections more easily while you are receiving Hulio treatment. This risk may increase if your lung function is reduced. These infections may be serious and include tuberculosis, infections caused by viruses, fungi, parasites or bacteria, or other unusual infectious organisms and sepsis (blood poisoning). In rare cases, these infections may be life-threatening. It is important to tell your doctor if you get symptoms such as fever, wounds, feeling tired or dental problems. Your doctor may recommend temporarily stopping Hulio.

Tuberculosis (TB)

- As cases of tuberculosis have been reported in patients treated with adalimumab, your doctor will check you for signs and symptoms of tuberculosis before starting Hulio. This will include a thorough medical evaluation including your medical history and screening tests (for example chest X-ray and a tuberculin test). The conduct and results of these tests should be recorded on your patient alert card. It is very important that you tell your doctor if you have ever had tuberculosis, or if you have been in close contact with someone who has had tuberculosis. Tuberculosis can develop during therapy even if you have had preventative treatment for tuberculosis. If symptoms of tuberculosis (persistent cough, weight loss, listlessness, mild fever), or any other infection appear during or after therapy tell your doctor immediately.

Travel/recurrent infection

- Tell your doctor if you reside or travel in regions where fungal infections such as histoplasmosis, coccidioidomycosis or blastomycosis are common.
- Tell your doctor if you have a history of recurrent infections or other conditions that increase the risk of infections.

Hepatitis B virus

- Tell your doctor if you are a carrier of the hepatitis B virus (HBV), if you have active HBV infection or if you think you might be at risk of contracting HBV. Your doctor will test you for HBV. Hulio can reactivate HBV infection in people who carry this virus. In some rare cases, especially if you are taking other medicines that suppress the immune system, reactivation of HBV infection can be life-threatening.

Age over 65 years

- If you are over 65 years you may be more susceptible to infections while taking Hulio. You and your doctor should pay special attention to signs of infection while you are being treated with Hulio. It is important to tell your doctor if you get symptoms of infections, such as fever, wounds, feeling tired or dental problems.
Surgery or dental procedure

- If you are about to have surgery or dental procedures, tell your doctor that you are taking Hulio. Your doctor may recommend temporarily stopping Hulio.

Demyelinating disease

- If you have or develop demyelinating disease (a disease that affects the insulating layer around the nerves), such as multiple sclerosis, your doctor will decide if you should receive or continue to receive Hulio. Tell your doctor immediately if you get symptoms like changes in your vision, weakness in your arms or legs or numbness or tingling in any part of the body.

Vaccine

- Certain vaccines contain living but weakened forms of bacteria or viruses that cause diseases and should not be given during treatment with Hulio in case they cause infections. Check with your doctor before you receive any vaccines. It is recommended that, if possible, children be given all the scheduled vaccinations for their age before they start treatment with Hulio. If you received Hulio while you are pregnant, your baby may be at higher risk for getting an infection for up to about five months after the last dose you received during pregnancy. It is important that you tell your baby's doctors and other health care professionals about your Hulio use during your pregnancy so they can decide when your baby should receive any vaccine.

Heart Failure

- It is important to tell your doctor if you have had or have a serious heart condition. If you have mild heart failure and you are being treated with Hulio your heart failure status must be closely monitored by your doctor. If you develop new or worsening symptoms of heart failure (e.g. shortness of breath, or swelling of your feet), you must contact your doctor immediately.

Fever, bruising, bleeding or looking pale

- In some patients the body may fail to produce enough of the blood cells that fight infections or help you to stop bleeding. If you develop a fever that does not go away, or you bruise or bleed very easily or look very pale, call your doctor right away. Your doctor may decide to stop treatment.

Cancer

- There have been very rare cases of certain kinds of cancer in children and adults taking adalimumab or other TNFα blockers. People with more serious rheumatoid arthritis who have had the disease for a long time may have a higher than average risk of getting lymphoma and leukaemia (cancers that affect blood cells and bone marrow). If you take Hulio the risk of getting lymphoma, leukaemia, or other cancers may increase. On rare occasions, a specific and severe type of lymphoma has been observed in some patients taking adalimumab. Some of those patients were also treated with the medicines azathioprine or mercaptopurine. Tell your doctor if you are taking azathioprine or mercaptopurine with Hulio.
- In addition cases of non-melanoma skin cancer have been observed in patients taking adalimumab. If new areas of damaged skin appear during or after treatment or if existing marks or areas of damage change appearance, tell your doctor.
- There have been cases of cancers, other than lymphoma, have been reported in patients with a specific type of lung disease called chronic obstructive pulmonary disease (COPD) treated with another TNFα blocker. If you have COPD, or you are a heavy smoker, you should discuss with your doctor whether treatment with a TNFα blocker is appropriate for you.
Children and adolescents

- Do not give Hulio to children with polyarticular juvenile idiopathic arthritis and chronic non-infectious uveitis below the age of 2 years.
- Do not give Hulio to children with enthesitis-related arthritis and Crohn's disease below the age of 6 years.
- Do not give Hulio to children with plaque psoriasis below the age of 4 years.
- Do not give Hulio to children with hidradenitis suppurativa below the age of 12 years.
- Do not use the 40 mg pre-filled syringe if doses other than 40 mg are recommended.

Other medicines and Hulio

Tell your doctor or pharmacist if you are taking, have recently taken or might take any other medicines.

Hulio can be taken together with methotrexate or certain disease-modifying anti-rheumatic agents (sulfasalazine, hydroxychloroquine, leflunomide and injectable gold preparations), corticosteroids or pain medications including non-steroidal anti-inflammatory drugs (NSAIDs).

You should not take Hulio with medicines containing the active substances anakinra or abatacept. The combination of Hulio and anakinra or abatacept is not recommended based upon the possible increased risk for infections, including serious infections and other potential pharmacological interactions. If you have questions, please ask your doctor.

Pregnancy and breast-feeding

- You should consider the use of adequate contraception to prevent pregnancy and continue its use for at least 5 months after the last Hulio injection.
- If you are pregnant, think you may be pregnant or are planning to have a baby, ask your doctor for advice about taking this medicine.
- Hulio should only be used during a pregnancy if needed.
- According to a pregnancy study, there was no higher risk of birth defects when the mother had received Hulio during pregnancy compared with mothers with the same disease who did not receive Hulio.
- Hulio can be used during breast-feeding.
- If you received Hulio during your pregnancy, your baby may have a higher risk for getting an infection.
- It is important that you tell your baby’s doctors and other health care professionals about your Hulio use during your pregnancy before the baby receives any vaccine. For more information on vaccines see the “Warnings and precautions”.

Driving and using machines

Hulio may have a minor influence on your ability to drive, cycle or use machines. Room spinning sensation (vertigo) and vision disturbances may occur after taking Hulio.

Hulio contains sodium and sorbitol

Each Hulio pre-filled syringe contains 38.2 mg of sorbitol. Sorbitol is a source of fructose. If your doctor has told you that you (or your child) have an intolerance to some sugars or if you have been diagnosed with hereditary fructose intolerance (HFI), a rare genetic disorder in which a person cannot break down fructose, talk to your doctor before you (or your child) take or receive this medicine.

Also this medicine contains less than 1 mmol of sodium (23 mg) per pre-filled syringe, that is to say essentially ‘sodium-free’.
3. **How to use Hulio**

Always use this medicine exactly as your doctor or pharmacist has told you. Check with your doctor or pharmacist if you are not sure. Your doctor may prescribe another strength of Hulio if you need a different dose.

**Adults with rheumatoid arthritis, psoriatic arthritis, ankylosing spondylitis or axial spondyloarthritis without radiographic evidence of ankylosing spondylitis**

The usual dose for adults with these conditions is 40 mg adalimumab given every two weeks as a single dose.

In rheumatoid arthritis, methotrexate is continued while using Hulio. If your doctor determines that methotrexate is inappropriate, Hulio can be given alone.

If you have rheumatoid arthritis and you do not receive methotrexate with your Hulio therapy, your doctor may decide to give you 40 mg adalimumab every week or 80 mg every other week.

**Children and adolescents with polyarticular juvenile idiopathic arthritis**

*Children and adolescents from 2 to 17 years of age weighing 10 kg to less than 30 kg:*  
The recommended dose of Hulio is 20 mg every other week.

*Children and adolescents from 2 to 17 years of age weighing 30 kg or more:*  
The recommended dose of Hulio is 40 mg every other week.

**Children and adolescents with enthesitis-related arthritis**

*Children and adolescents from 6 to 17 years of age weighing 15 kg to less than 30 kg:*  
The recommended dose of Hulio is 20 mg every other week.

*Children and adolescents from 6 to 17 years of age weighing 30 kg or more:*  
The recommended dose of Hulio is 40 mg every other week.

**Adults with psoriasis**

The usual dose for adults with psoriasis is an initial dose of 80 mg (as two 40 mg injections in one day), followed by 40 mg given every other week starting one week after the initial dose. You should continue to inject Hulio for as long as your doctor has told you. If this dose does not work well enough, your doctor may increase the dose frequency to 40 mg every week or 80 mg every other week.

**Children or adolescents with plaque psoriasis**

*Children and adolescents from 4 to 17 years of age weighing 15 kg to less than 30 kg:*  
The recommended dose of Hulio is an initial dose of 20 mg, followed by 20 mg one week later, thereafter the usual dose is 20 mg every other week.

*Children and adolescents from 4 to 17 years of age weighing 30 kg or more:*  
The recommended dose of Hulio is an initial dose of 40 mg, followed by 40 mg one week later, thereafter the usual dose is 40 mg every other week.

**Adults with hidradenitis suppurativa**

The usual dose regimen for hidradenitis suppurativa is an initial dose of 160 mg (as four 40 mg injections in one day or two 40 mg injections per day for two consecutive days), followed by an 80 mg
dose (as two 40 mg injections on the same day) two weeks later. After two further weeks, continue with a dose of 40 mg every week or 80 mg every other week, as prescribed by your doctor.

It is recommended that you use an antiseptic wash daily on the affected areas.

Adolescents with hidradenitis suppurativa from 12 to 17 years of age weighing at least 30 kg

The recommended dose of Hulio is an initial dose of 80 mg (two 40 mg injections in one day), followed by 40 mg every other week starting one week later. If this dose does not work well enough then your child’s doctor may increase this to 40 mg every week or 80 mg every other week.

It is recommended that your child uses an antiseptic wash daily on the affected areas.

Adults with Crohn’s disease

The usual dose regimen for Crohn’s disease is 80 mg (as two 40 mg injections in one day) initially, followed by 40 mg every other week starting two weeks later. If a faster effect is required your doctor may prescribe an initial dose of 160 mg (as four 40 mg injections in one day or two 40 mg injections per day for two consecutive days), followed by 80 mg (as two 40 mg injections in one day) two weeks later, and thereafter as 40 mg every other week. If this dose does not work well enough, your doctor may increase the dose frequency to 40 mg every week or 80 mg every other week.

Children or adolescents with Crohn's disease

Children or adolescents from 6 to 17 years weighing less than 40 kg:
The usual dose regimen is 40 mg adalimumab initially, followed by 20 mg two weeks later. If a faster response is required, your doctor may prescribe an initial dose of 80 mg (as two 40 mg injections in one day) followed by 40 mg two weeks later.

Thereafter, the usual dose is 20 mg every other week. If this dose does not work well enough, your doctor may increase the dose frequency to 20 mg every week.

Children or adolescents from 6 to 17 years weighing 40 kg or more:
The usual dose regimen is 80 mg (as two 40 mg injections in one day) initially, followed by 40 mg two weeks later. If a faster response is required, your doctor may prescribe an initial dose of 160 mg (as four 40 mg injections in one day or as two 40 mg injections per day for two consecutive days) followed by 80 mg (as two 40 mg injections in one day) two weeks later.

Thereafter, the usual dose is 40 mg every other week. If this dose does not work well enough, your doctor may increase the dosage frequency to 40 mg every week or 80 mg every other week.

Patients requiring a dose less than 40 mg should use the 40 mg vial presentation of Hulio.

Adults with ulcerative colitis

The usual Hulio dose for adults with ulcerative colitis is 160 mg initially (given as four 40 mg injections in one day, or as two 40 mg injections per day for two consecutive days) followed by 80 mg (as two 40 mg injections in one day) two weeks later, and then 40 mg every other week. If this dose does not work well enough, your doctor may increase the dose frequency to 40 mg every week or 80 mg every other week.

Adults with non-infectious uveitis affecting the back of the eye

The usual dose for adults with non-infectious uveitis is an initial dose of 80 mg (as two injections in one day), followed by 40 mg given every other week starting one week after the initial dose. You should continue to inject Hulio for as long as your doctor has told you.
In non-infectious uveitis, corticosteroids or other medicines that influence the immune system may be continued while using Hulio. Hulio can also be given alone.

**Children with chronic non-infectious uveitis**

*Children and adolescents from 2 to 17 years of age weighing less than 30 kg:*

The usual dose of Hulio is 20 mg every other week with methotrexate.

Your child’s doctor may also prescribe an initial dose of 40 mg which may be administered one week prior to the start of the usual recommended dose.

*Children and adolescents from 2 to 17 years of age weighing 30 kg or more:*

The usual dose of Hulio is 40 mg every other week with methotrexate.

Your child’s doctor may also prescribe an initial dose of 80 mg which may be administered one week prior to the start of the usual recommended dose.

For patients who are prescribed a dose less than 40 mg, Hulio 40 mg/0.8 ml solution for injection in a vial (available from your pharmacist) should be used.

**Method and route of administration**

Hulio is administered by injection under the skin (subcutaneous use).

Detailed instructions on how to inject Hulio are provided in Section 7 - Instructions for use.

**If you use more Hulio than you should**

If you accidentally inject Hulio more frequently than you should, call your doctor or pharmacist and explain that you have taken more than required. Always take the outer carton of the medicine with you, even if it is empty.

**If you forget to use Hulio**

If you forget to give yourself an injection, you should inject the next dose of Hulio as soon as you remember. Then take your next dose as you would have on your originally scheduled day, had you not forgotten a dose.

**If you stop using Hulio**

The decision to stop using Hulio should be discussed with your doctor. Your symptoms may return upon stopping treatment.

If you have any further questions on the use of this medicine, ask your doctor or pharmacist.

**4. Possible side effects**

Like all medicines, this medicine can cause side effects, although not everybody gets them.

Most side effects are mild to moderate. However, some may be serious and require urgent medical treatment.

Side effects may occur up to 4 months or more after the last Hulio injection.
Seek medical attention urgently if you develop any of the following signs of allergic reaction or heart failure:

- severe rash, hives;
- swollen face, hands or feet;
- trouble breathing or swallowing;
- pale complexion, dizziness, persistent fever, bruising or bleeding very easily.

Tell your doctor as soon as possible, if you notice any of the following:

- signs and symptoms of infection such as fever, feeling sick, wounds, dental problems, burning on urination, feeling weak or tired or coughing;
- symptoms of nerve problems such as tingling, numbness, double vision or arm or leg weakness;
- signs of skin cancer such as a bump or open sore that doesn't heal;
- signs and symptoms suggestive of blood disorders such as persistent fever, bruising, bleeding, paleness.

The following side effects have been observed with adalimumab:

**Very common** (may affect more than 1 in 10 people):

- injection site reactions (including pain, swelling, redness or itching);
- respiratory tract infections (including cold, runny nose, sinus infection, throat infection, pneumonia);
- abnormal blood results,
- headache;
- abdominal (belly) pain;
- nausea and vomiting;
- pain in bone and muscles.

**Common** (may affect up to 1 in 10 people):

- any infection (including tuberculosis, blood poisoning, influenza, cellulitis, shingles, ear infections, tooth infections, cold sores, reproductive tract infections, urinary tract infection, fungal infections, joint infections);
- benign tumours;
- skin cancer;
- mild allergic reactions (including seasonal allergy);
- dehydration;
- mood swings (including depression);
- anxiety;
- difficulty sleeping;
- sensation disorders such as tingling, prickling or numbness;
- migraine;
- neck or back pain;
- vision disturbances;
- eye/eyelid inflammation or swelling;
- vertigo (sensation of the room spinning);
- cough;
- sensation of heart beating rapidly;
- high blood pressure;
- skin flushing;
- blood clot;
- asthma;
- bleeding in the stomach;
- indigestion, bloating, heart burn;
- acidity/acid reflux;
- dry eyes, dry mouth;
- itching, inflammation of the skin (including eczema);
• increased sweating;
• hair loss;
• new or worsening psoriasis (red, flaky skin);
• muscle spasms;
• blood in urine;
• kidney problems;
• slow healing of wounds.

**Uncommon** (may affect up to 1 in 100 people):
• cancer of the lymph system (lymphoma);
• immune disorders that could affect the lungs, skin and lymph nodes (most commonly as a condition called sarcoidosis);
• inflammation of blood vessels;
• tremor;
• nerve damage;
• stroke;
• double vision;
• hearing loss, buzzing;
• irregular heart beat;
• lung diseases causing shortness of breath (including inflammation);
• blockage in an artery of the lung;
• excessive fluid around the lung;
• inflammation of the pancreas;
• difficulty in swallowing;
• gallbladder inflammation, gallbladder stones;
• fatty liver (build up of fat in liver cells);
• night sweats;
• scarring;
• abnormal muscle breakdown;
• systemic lupus erythematosus (including inflammation of skin, heart, lung, joints and other organ systems);
• excessive night urination;
• impotence.

**Rare** (may affect up to 1 in 1,000 people):
• leukaemia (cancer affecting the blood and bone marrow);
• multiple sclerosis;
• nerve disorders (such as inflammation of the optic nerve to the eye, and Guillain-Barré syndrome, a condition that may cause muscle weakness, abnormal sensations, tingling in the arms and upper body);
• heart attack;
• pulmonary fibrosis (scarring of the lung);
• hole/tear in the intestine;
• inflammation of the liver;
• inflammation of blood vessels in the skin;
• Stevens-Johnson syndrome;
• inflammatory skin rash;
• lupus-like syndrome.

**Not known** (frequency cannot be estimated from available data):
• hepatosplenic T-cell lymphoma (a rare blood cancer);
• Merkel cell carcinoma (a type of skin cancer);
• liver failure;
• worsening skin rash with muscle weakness.
Reporting of side effects

If you get any side effects, talk to your doctor or pharmacist. This includes any possible side effects not listed in this leaflet.

You can also report side effects directly via the national reporting system listed in Appendix V. By reporting side effects you can help provide more information on the safety of this medicine.

5. **How to store Hulio**

Keep this medicine out of the sight and reach of children.

Do not use this medicine after the expiry date which is stated on the label/blister/carton after EXP. The expiry date refers to the last day of that month.

Store in a refrigerator (2°C – 8°C). Do not freeze.

Keep the pre-filled syringe in the outer carton in order to protect from light.

**Alternative Storage:**

When needed (for example when you are travelling), a single Hulio pre-filled syringe may be stored at room temperature (up to 25°C) for a maximum period of 14 days – be sure to protect it from light. Once removed from the refrigerator for room temperature storage, the syringe **must be used within 14 days or discarded**, even if it is returned to the refrigerator.

You should record the date when the syringe is first removed from refrigerator, and the date after which it should be discarded.

Do not throw away any medicines via wastewater or household waste. Ask your pharmacist how to throw away medicines you no longer use. These measures will help protect the environment.

6. **Contents of the pack and other information**

**What Hulio contains**
- The active substance is adalimumab.
- The other ingredients are monosodium glutumate, sorbitol, methionine, polysorbate 80, hydrochloric acid and water for injections.

**What Hulio looks like and contents of the pack**

Hulio 40 mg solution for injection (injection) in pre-filled syringe is supplied as a sterile solution of 40 mg adalimumab dissolved in 0.8 ml clear or slightly opalescent, colourless to pale brownish-yellow solution.

The Hulio pre-filled syringe is made of plastic syringe with a stopper and a needle with a needle cap. Each pack contains 1, 2 or 6 pre-filled syringes with 2, 2 or 6 alcohol pads. Not all pack sizes may be marketed.

Hulio is also available as a vial for paediatric use or a pre-filled pen.

Other sources of information

Detailed information on this medicine is available on the European Medicines Agency web site: http://www.ema.europa.eu.

7. Instructions for use

Read the instructions carefully and follow them step by step. Your doctor, nurse or other healthcare professional will first show you how to inject Hulio pre-filled syringe. Ask your doctor or nurse if there is anything you do not understand.

Do not attempt to self-inject until you are sure that you understand how to prepare and administer the injection. After proper training, the injection can be self-administered or given by another person, for example a family member or carer.

Each pre-filled syringe is for single-use only and contains one 40 mg dose of adalimumab.

Do not mix the Hulio solution with any other medicine.

To help you remember which day(s) of the week Hulio should be injected, it may be helpful to make a note on a calendar or in a diary.

Before you start

Find a quiet area with a well-lit, clean and flat work surface and gather all the supplies you will need to give yourself or receive the injection.
Supplies you will need:

- 1 pre-filled syringe
- 1 alcohol swab
- 1 sharps disposal container (not included in Hulio pack)
- 1 gauze pad or cotton ball (not included in Hulio pack)

If you do not have all the supplies you need, ask your nurse or pharmacist.

Preparing the pre-filled syringe

The pre-filled syringes should be stored in the fridge (between 2°C to 8°C).

- Take a single pre-filled syringe out of the fridge at least 30 minutes before you intend to use it to allow the contents to reach room temperature.
  - DO NOT use other heat sources such as a microwave oven or hot water to warm the syringe.
  - DO NOT put the syringe back in the fridge after it has reached room temperature.
- Check the expiry date printed on the syringe.
  - DO NOT use the syringe if past the expiry date.
- Check syringe to make sure the medication is at or near the Fill Marker (you may need to shake gently to see the liquid), and the liquid is clear, colourless and has no particles.
  - DO NOT use the syringe if the medication is not near the Fill Marker.
  - DO NOT use the syringe if the liquid is cloudy, discoloured, or has particles in it.

Injection steps

Follow the below steps carefully each time you inject Hulio pre-filled syringe:

**Step 1 - Choose and prepare injection site**

Hulio pre-filled syringe is for subcutaneous injection. It should be injected into the thigh or abdomen.

You should rotate and change your injection site each time, staying at least 3 cm from the previous site used.

If you are injecting into the abdomen, choose a site that is at least 5 cm away from the belly button.

- DO NOT inject into skin that is red, hard, bruised, or tender.
- DO NOT inject into scars or stretch marks.
- If you have psoriasis, DO NOT inject into any raised,
thick, red, or scaly skin patches, or lesions.
- DO NOT inject through clothes. Roll back any clothing that may interfere with the injection site.

<table>
<thead>
<tr>
<th>Step 2 - Wash hands</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wash your hands with soap and water.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 3 - Prepare injection site</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wipe the skin at the chosen injection site with an alcohol swab.</td>
</tr>
<tr>
<td>• Wait for it to dry on its own, do not blow dry it.</td>
</tr>
<tr>
<td>• DO NOT touch this area again before giving the injection.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 4 - Uncap needle</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pull the needle cover straight off the syringe. A few drops of liquid may come out of the needle, this is normal. It is also normal to see air bubble(s).</td>
</tr>
<tr>
<td>• DO NOT remove the needle cover until you are ready to inject.</td>
</tr>
<tr>
<td>• DO NOT twist or bend the needle cover while removing it, this may damage the needle.</td>
</tr>
<tr>
<td>• DO NOT touch or pull back on the plunger at any time.</td>
</tr>
<tr>
<td>• DO NOT re-cap or touch the needle with your fingers, or let the needle touch anything.</td>
</tr>
<tr>
<td>• DO NOT expel any air bubble(s).</td>
</tr>
<tr>
<td>• DO NOT use the pre-filled syringe if dropped after uncapping.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 5 - Squeeze &amp; hold injection site</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gently squeeze the injection site to create a raised area, and hold that area firmly.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 6 - Insert needle into site</th>
</tr>
</thead>
<tbody>
<tr>
<td>At a 45° angle to the injection site, use a quick dart-like motion to insert the needle into the site.</td>
</tr>
<tr>
<td>Be careful to insert the needle so that it will not inject into your fingers holding the injection site.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 7 - Inject Hulio</th>
</tr>
</thead>
<tbody>
<tr>
<td>After the needle is completely inserted, let go of the site you are squeezing.</td>
</tr>
<tr>
<td>Slowly push the plunger completely down until all the medicine is injected and the syringe is empty.</td>
</tr>
<tr>
<td>• If the plunger is not pressed all the way the safety feature will not activate afterwards to cover the needle.</td>
</tr>
<tr>
<td>• DO NOT move, twist, or rotate the syringe during injection.</td>
</tr>
</tbody>
</table>
### Step 8 - End of injection, remove syringe

Pull the syringe away from the injection site at the same angle as inserted and release your thumb from the plunger.

Each pre-filled syringe has a safety feature, this will retract and cover the needle after the plunger is released. If the needle did not retract, carefully place the used syringe into a sharps container to avoid injury.

After injection, if slight bleeding occurs from the injection site, press a gauze pad or cotton ball lightly against the skin for a few seconds - DO NOT rub the injection site. If needed, cover the injection site with a plaster.

### Step 9 - Dispose syringe & cap

Dispose of the used syringe and cap in an approved sharps disposal container.

Check with your healthcare provider for instructions on how to properly dispose of a filled sharps container.

- DO NOT re-use the syringe.
- DO NOT re-cap the needle.
- DO NOT throw the sharps container in your household bin.
- DO NOT recycle your used sharps disposal container.
- Always keep your sharps container out of the sight and reach of children.
This medicine is subject to additional monitoring. This will allow quick identification of new safety information. You can help by reporting any side effects you may get. See the end of section 4 for how to report side effects.

Read all of this leaflet carefully before you start using this medicine because it contains important information for you.
- Keep this leaflet. You may need to read it again.
- Your doctor will also give you a Patient Alert Card, which contains important safety information that you need to be aware of before you are given Hulio and during treatment with Hulio. Keep this Patient Alert Card with you at all times and for 4 months after your last injection of Hulio.
- If you have any further questions, ask your doctor or pharmacist.
- This medicine has been prescribed for you only. Do not pass it on to others. It may harm them, even if their signs of illness are the same as yours.
- If you get any side effects, talk to your doctor or pharmacist. This includes any possible side effects not listed in this leaflet. See section 4.

What is in this leaflet

1. What Hulio is and what it is used for
2. What you need to know before you use Hulio
3. How to use Hulio
4. Possible side effects
5. How to store Hulio
6. Contents of the pack and other information
7. Instructions for use

1. What Hulio is and what it is used for

Hulio contains the active substance adalimumab, a medicine that acts on your body’s immune (defence) system.

Hulio is intended for the treatment of the following inflammatory diseases:
- rheumatoid arthritis;
- polyarticular juvenile idiopathic arthritis;
- enthesitis-related arthritis;
- ankylosing spondylitis;
- axial spondyloarthritis without radiographic evidence of ankylosing spondylitis;
- psoriatic arthritis;
- psoriasis;
- hidradenitis suppurativa;
- Crohn’s disease;
- ulcerative colitis;
- non-infectious uveitis in adults and children.

The active ingredient in Hulio, adalimumab, is a monoclonal antibody. Monoclonal antibodies are proteins that attach to specific target in the body. The target of adalimumab is another protein called tumour necrosis factor (TNFα), which is present at increased levels in the inflammatory diseases listed above. By attaching to TNFα, Hulio decreases the process of inflammation in these diseases.
Rheumatoid arthritis

Rheumatoid arthritis is an inflammatory disease of the joints.

Hulio is used to treat rheumatoid arthritis in adults. If you have moderate to severe active rheumatoid arthritis, you may first be given other disease-modifying medicines, such as methotrexate. If these medicines do not work well enough, you will be given Hulio to treat your rheumatoid arthritis.

Hulio can also be used to treat severe, active and progressive rheumatoid arthritis without previous methotrexate treatment.

Hulio can slow down the damage to the cartilage and bone of the joints caused by the disease and improve physical function.

Usually, Hulio is used with methotrexate. If your doctor considers that methotrexate is inappropriate, Hulio can be given alone.

Polyarticular juvenile idiopathic arthritis and enthesitis-related arthritis

Polyarticular juvenile idiopathic arthritis and enthesitis-related arthritis are inflammatory diseases of the joints that usually first appear in childhood.

Hulio is used to treat polyarticular juvenile idiopathic arthritis in children and adolescents aged 2 to 17 years, and enthesitis-related arthritis in children and adolescents aged 6 to 17 years. Patients may first be given other disease-modifying medicines, such as methotrexate. If these medicines do not work well enough, patients will be given Hulio to treat their polyarticular juvenile idiopathic arthritis or enthesitis-related arthritis.

Ankylosing spondylitis and axial spondyloarthritis without radiographic evidence of ankylosing spondylitis

Ankylosing spondylitis and axial spondyloarthritis without radiographic evidence of ankylosing spondylitis are inflammatory diseases of the spine.

Hulio is used to treat ankylosing spondylitis and axial spondyloarthritis without radiographic evidence of ankylosing spondylitis in adults. If you have ankylosing spondylitis or axial spondyloarthritis without radiographic evidence of ankylosing spondylitis, you will first be given other medicines. If these medicines do not work well enough, you will be given Hulio to reduce the signs and symptoms of your disease.

Psoriatic arthritis

Psoriatic arthritis is an inflammatory disease of the joints associated with psoriasis.

Hulio is used to treat psoriatic arthritis in adults. Hulio can slow down the damage to the cartilage and bone of the joints caused by the disease and improve physical function.

Plaque psoriasis in adults and children

Plaque psoriasis is an inflammatory skin condition that causes red, flaky, crusty patches of skin covered with silvery scales. Plaque psoriasis can also affect the nails, causing them to crumble, become thickened and lift away from the nail bed which can be painful. Psoriasis is believed to be caused by a problem with the body’s immune system that leads to an increased production of skin cells.
Hulio is used to treat moderate to severe plaque psoriasis in adults. Hulio is also used to treat severe plaque psoriasis in children and adolescents aged 4 to 17 years whom medicines applied to the skin and treatment with UV light have either not worked very well or are not suitable.

**Hidradenitis suppurativa in adults and adolescents**

Hidradenitis suppurativa (sometimes called ‘acne inversa’) is a long-term and often painful inflammatory skin disease. Symptoms may include tender nodules (lumps) and abscesses (boils) that may leak pus. It most commonly affects specific areas of the skin, such as under the breasts, the armpits, inner thighs, groin and buttocks. Scarring may also occur in affected areas.

Hulio is used to treat hidradenitis suppurativa in adults, and adolescents from 12 years of age. Hulio can reduce the number of nodules and abscesses you have, and the pain that is often associated with the disease. You may first be given other medicines. If these medicines do not work well enough, you will be given Hulio.

**Crohn’s disease in adults and children**

Crohn’s disease is an inflammatory disease of the gut.

Hulio is used to treat Crohn’s disease in adults, and children aged 6 to 17 years. If you have Crohn’s disease you will first be given other medicines. If you do not respond well enough to these medicines, you will be given Hulio to reduce the signs and symptoms of your Crohn’s disease.

**Ulcerative colitis**

Ulcerative colitis is an inflammatory disease of the bowel.

Hulio is used to treat ulcerative colitis in adults. If you have ulcerative colitis you will first be given other medicines. If these medicines do not work well enough, you will be given Hulio to reduce the signs and symptoms of your disease.

**Non-infectious uveitis in adults and children**

Non-infectious uveitis is an inflammatory disease affecting certain parts of the eye. This inflammation leads to a decrease of vision and/or the presence of floaters in the eye (black dots or wispy lines that move across the field of vision). Hulio works by reducing this inflammation.

Hulio is used to treat:
- adults with non-infectious uveitis with inflammation affecting the back of the eye.
- children and adolescents aged 2 to 17 years with chronic non-infectious uveitis who have inflammation affecting the front of the eye.

### 2. What you need to know before you use Hulio

**Do not use Hulio:**

- If you are allergic to adalimumab or any of the other ingredients of this medicine (listed in section 6).
- If you have a severe infection, including tuberculosis see “Warnings and precautions”). It is important that you tell your doctor if you have symptoms of infections, e.g. fever, wounds, feeling tired, dental problems.
- If you have moderate or severe heart failure. It is important to tell your doctor if you have had or have a serious heart condition (see “Warnings and precautions”).
Warnings and precautions

Talk to your doctor or pharmacist before using Hulio.

Allergic Reaction

If you have allergic reactions with symptoms such as chest tightness, wheezing, dizziness, swelling or a rash, do not inject more Hulio and contact your doctor immediately since, in rare cases, these reactions can be life-threatening.

Infections

- If you have an infection, including long-term or localised infection (for example, leg ulcer) consult your doctor before starting Hulio. If you are unsure, contact your doctor.
- You might get infections more easily while you are receiving Hulio treatment. This risk may increase if your lung function is reduced. These infections may be serious and include tuberculosis, infections caused by viruses, fungi, parasites or bacteria, or other unusual infectious organisms and sepsis (blood poisoning). In rare cases, these infections may be life-threatening. It is important to tell your doctor if you get symptoms such as fever, wounds, feeling tired or dental problems. Your doctor may recommend temporarily stopping Hulio.

Tuberculosis (TB)

- As cases of tuberculosis have been reported in patients treated with adalimumab, your doctor will check you for signs and symptoms of tuberculosis before starting Hulio. This will include a thorough medical evaluation including your medical history and screening tests (for example chest X-ray and a tuberculin test). The conduct and results of these tests should be recorded on your patient alert card. It is very important that you tell your doctor if you have ever had tuberculosis, or if you have been in close contact with someone who has had tuberculosis. Tuberculosis can develop during therapy even if you have had preventative treatment for tuberculosis. If symptoms of tuberculosis (persistent cough, weight loss, listlessness, mild fever), or any other infection appear during or after therapy tell your doctor immediately.

Travel/recurrent infection

- Tell your doctor if you reside or travel in regions where fungal infections such as histoplasmosis, coccidioidomycosis or blastomycosis are common.
- Tell your doctor if you have a history of recurrent infections or other conditions that increase the risk of infections.

Hepatitis B virus

- Tell your doctor if you are a carrier of the hepatitis B virus (HBV), if you have active HBV infection or if you think you might be at risk of contracting HBV. Your doctor will test you for HBV. Hulio can reactivate HBV infection in people who carry this virus. In some rare cases, especially if you are taking other medicines that suppress the immune system, reactivation of HBV infection can be life-threatening.

Age over 65 years

- If you are over 65 years you may be more susceptible to infections while taking Hulio. You and your doctor should pay special attention to signs of infection while you are being treated with Hulio. It is important to tell your doctor if you get symptoms of infections, such as fever, wounds, feeling tired or dental problems.
Surgery or dental procedure

- If you are about to have surgery or dental procedures, tell your doctor that you are taking Hulio. Your doctor may recommend temporarily stopping Hulio.

Demyelinating disease

- If you have or develop demyelinating disease (a disease that affects the insulating layer around the nerves), such as multiple sclerosis, your doctor will decide if you should receive or continue to receive Hulio. Tell your doctor immediately if you get symptoms like changes in your vision, weakness in your arms or legs or numbness or tingling in any part of the body.

Vaccine

- Certain vaccines contain living but weakened forms of bacteria or viruses that cause diseases and should not be given during treatment with Hulio in case they cause infections. Check with your doctor before you receive any vaccines. It is recommended that, if possible, children be given all the scheduled vaccinations for their age before they start treatment with Hulio. If you received Hulio while you are pregnant, your baby may be at higher risk for getting an infection for up to about five months after the last dose you received during pregnancy. It is important that you tell your baby's doctors and other health care professionals about your Hulio use during your pregnancy so they can decide when your baby should receive any vaccine.

Heart Failure

- It is important to tell your doctor if you have had or have a serious heart condition. If you have mild heart failure and you are being treated with Hulio your heart failure status must be closely monitored by your doctor. If you develop new or worsening symptoms of heart failure (e.g. shortness of breath, or swelling of your feet), you must contact your doctor immediately.

Fever, bruising, bleeding or looking pale

- In some patients the body may fail to produce enough of the blood cells that fight infections or help you to stop bleeding. If you develop a fever that does not go away, or you bruise or bleed very easily or look very pale, call your doctor right away. Your doctor may decide to stop treatment.

Cancer

- There have been very rare cases of certain kinds of cancer in children and adults taking adalimumab or other TNFα blockers. People with more serious rheumatoid arthritis who have had the disease for a long time may have a higher than average risk of getting lymphoma and leukaemia (cancers that affect blood cells and bone marrow). If you take Hulio the risk of getting lymphoma, leukaemia, or other cancers may increase. On rare occasions, a specific and severe type of lymphoma has been observed in some patients taking adalimumab. Some of those patients were also treated with the medicines azathioprine or mercaptopurine. Tell your doctor if you are taking azathioprine or mercaptopurine with Hulio.
- In addition cases of non-melanoma skin cancer have been observed in patients taking adalimumab. If new areas of damaged skin appear during or after treatment or if existing marks or areas of damage change appearance, tell your doctor.
- There have been cases of cancers, other than lymphoma, have been reported in patients with a specific type of lung disease called chronic obstructive pulmonary disease (COPD) treated with another TNFα blocker. If you have COPD, or you are a heavy smoker, you should discuss with your doctor whether treatment with a TNFα blocker is appropriate for you.
**Children and adolescents**

- Do not give Hulio to children with polyarticular juvenile idiopathic arthritis and chronic non-infectious uveitis below the age of 2 years.
- Do not give Hulio to children with enthesitis-related arthritis and Crohn's disease below the age of 6 years.
- Do not give Hulio to children with plaque psoriasis below the age of 4 years.
- Do not give Hulio to children with hidradenitis suppurativa below the age of 12 years.
- Do not use the 40 mg pre-filled pen if doses other than 40 mg are recommended.

**Other medicines and Hulio**

Tell your doctor or pharmacist if you are taking, have recently taken or might take any other medicines.

Hulio can be taken together with methotrexate or certain disease-modifying anti-rheumatic agents (sulfasalazine, hydroxychloroquine, leflunomide and injectable gold preparations), corticosteroids or pain medications including non-steroidal anti-inflammatory drugs (NSAIDs).

You should not take Hulio with medicines containing the active substances anakinra or abatacept. The combination of Hulio and anakinra or abatacept is not recommended based upon the possible increased risk for infections, including serious infections and other potential pharmacological interactions. If you have questions, please ask your doctor.

**Pregnancy and breast-feeding**

- You should consider the use of adequate contraception to prevent pregnancy and continue its use for at least 5 months after the last Hulio injection.
- If you are pregnant, think you may be pregnant or are planning to have a baby, ask your doctor for advice about taking this medicine.
- Hulio should only be used during a pregnancy if needed.
- According to a pregnancy study, there was no higher risk of birth defects when the mother had received Hulio during pregnancy compared with mothers with the same disease who did not receive Hulio.
- Hulio can be used during breast-feeding.
- If you received Hulio during your pregnancy, your baby may have a higher risk for getting an infection.
- It is important that you tell your baby’s doctors and other health care professionals about your Hulio use during your pregnancy before the baby receives any vaccine. For more information on vaccines see the “Warnings and precautions” section.

**Driving and using machines**

Hulio may have a minor influence on your ability to drive, cycle or use machines. Room spinning sensation (vertigo) and vision disturbances may occur after taking Hulio.

**Hulio contains sodium and sorbitol**

Each Hulio pre-filled pen contains 38.2 mg of sorbitol. Sorbitol is a source of fructose. If your doctor has told you that you (or your child) have an intolerance to some sugars or if you have been diagnosed with hereditary fructose intolerance (HFI), a rare genetic disorder in which a person cannot break down fructose, talk to your doctor before you (or your child) take or receive this medicine.

Also this medicine contains less than 1 mmol of sodium (23 mg) per pre-filled pen, that is to say essentially ‘sodium-free’.
3. **How to use Hulio**

Always use this medicine exactly as your doctor or pharmacist has told you. Check with your doctor or pharmacist if you are not sure. Your doctor may prescribe another strength of Hulio if you need a different dose.

**Adults with rheumatoid arthritis, psoriatic arthritis, ankylosing spondylitis or axial spondyloarthritis without radiographic evidence of ankylosing spondylitis**

The usual dose for adults with these conditions is 40 mg adalimumab given every two weeks as a single dose.

In rheumatoid arthritis, methotrexate is continued while using Hulio. If your doctor determines that methotrexate is inappropriate, Hulio can be given alone.

If you have rheumatoid arthritis and you do not receive methotrexate with your Hulio therapy, your doctor may decide to give you 40 mg adalimumab every week or 80 mg every other week.

**Children and adolescents with polyarticular juvenile idiopathic arthritis**

*Children and adolescents from 2 to 17 years of age weighing 10 kg to less than 30 kg:*  
The recommended dose of Hulio is 20 mg every other week.

*Children and adolescents from 2 to 17 years of age weighing 30 kg or more:*  
The recommended dose of Hulio is 40 mg every other week.

**Children with enthesitis-related arthritis**

*Children and adolescents from 6 to 17 years of age weighing 15 kg to less than 30 kg:*  
The recommended dose of Hulio is 20 mg every other week.

*Children and adolescents from 6 to 17 years of age weighing 30 kg or more:*  
The recommended dose of Hulio is 40 mg every other week.

**Adults with psoriasis**

The usual dose for adults with psoriasis is an initial dose of 80 mg (as two 40 mg injections in one day), followed by 40 mg given every other week starting one week after the initial dose. You should continue to inject Hulio for as long as your doctor has told you. If this dose does not work well enough, your doctor may increase the dose frequency to 40 mg every week or 80 mg every other week.

**Children or adolescents with plaque psoriasis**

*Children and adolescents from 4 to 17 years of age weighing 15 kg to less than 30 kg:*  
The recommended dose of Hulio is an initial dose of 20 mg, followed by 20 mg one week later. Thereafter the usual dose is 20 mg every other week.

*Children and adolescents from 4 to 17 years of age weighing 30 kg or more:*  
The recommended dose of Hulio is an initial dose of 40 mg, followed by 40 mg one week later. Thereafter the usual dose is 40 mg every other week.

**Adults with hidradenitis suppurativa**

The usual dose regimen for hidradenitis suppurativa is an initial dose of 160 mg (as four 40 mg injections in one day or two 40 mg injections per day for two consecutive days), followed by an 80 mg
should continue to inject Hulio for as long as your doctor has told you.

It is recommended that you use an antiseptic wash daily on the affected areas.

**Adolescents with hidradenitis suppurativa (from 12 years of age, weighing at least 30 kg)**

The recommended dose of Hulio is an initial dose of 80 mg (two 40 mg injections in one day), followed by 40 mg every other week starting one week later. If this dose does not work well enough then your child’s doctor may increase this to 40 mg every week or 80 mg every other week.

It is recommended that your child uses an antiseptic wash daily on the affected areas.

**Adults with Crohn’s disease**

The usual dose regimen for Crohn’s disease is 80 mg (as two 40 mg injections in one day) initially, followed by 40 mg every other week starting two weeks later. If a faster effect is required your doctor may prescribe an initial dose of 160 mg (as four 40 mg injections in one day, or two 40 mg injections per day for two consecutive days), followed by 80 mg two weeks later, and thereafter as 40 mg every other week. If this dose does not work well enough, your doctor may increase the dose frequency to 40 mg every week or 80 mg every other week.

**Children or adolescents with Crohn’s disease**

*Children or adolescents from 6 to 17 years weighing less than 40 kg:*

The usual dose regimen is 40 mg initially, followed by 20 mg two weeks later. If a faster response is required, your doctor may prescribe an initial dose of 80 mg (as two 40 mg injections in one day) followed by 40 mg two weeks later.

Thereafter, the usual dose is 20 mg every other week. If this dose does not work well enough, your doctor may increase the dose frequency to 20 mg every week.

*Children or adolescents from 6 to 17 years weighing 40 kg or more:*

The usual dose regimen is 80 mg (as two 40 mg injections in one day) initially, followed by 40 mg two weeks later. If a faster response is required, your doctor may prescribe an initial dose of 160 mg (as four 40 mg injections in one day or two 40 mg injections per day for two consecutive days) followed by 80 mg (as two 40 mg injections in one day) two weeks later.

Thereafter, the usual dose is 40 mg every other week. If this dose does not work well enough, your doctor may increase the dose frequency to 40 mg every week or 80 mg every other week.

Patients requiring a dose less than 40 mg should use the 40 mg vial presentation of Hulio.

**Adults with ulcerative colitis**

The usual Hulio dose for adults with ulcerative colitis is 160 mg at initially (given as four 40 mg injections in one day, or as two 40 mg injections per day for two consecutive days) followed by 80 mg two weeks later, and then 40 mg every other week. If this dose does not work well enough, your doctor may increase the dose frequency to 40 mg every week or 80 mg every other week.

**Adults with non-infectious uveitis affecting the back of the eye**

The usual dose for adults with non-infectious uveitis is an initial dose of 80 mg (as two injections in one day), followed by 40 mg given every other week starting one week after the initial dose. You should continue to inject Hulio for as long as your doctor has told you.
In non-infectious uveitis, corticosteroids or other medicines that influence the immune system may be continued while using Hulio. Hulio can also be given alone.

**Children with chronic non-infectious uveitis**

*Children and adolescents from 2 to 17 years of age weighing less than 30 kg:*

The usual dose of Hulio is 20 mg every other week with methotrexate.

Your child’s doctor may also prescribe an initial dose of 40 mg which may be administered one week prior to the start of the usual recommended dose.

*Children and adolescents from 2 to 17 years of age weighing 30 kg or more:*

The usual dose of Hulio is 40 mg every other week with methotrexate.

Your child’s doctor may also prescribe an initial dose of 80 mg (taken as 2 injections in 1 day) which may be administered one week prior to the start of the usual recommended dose.

For patients who are prescribed a dose less than 40 mg, Hulio 40 mg/0.8 ml solution for injection in a vial (available from your pharmacist) should be used.

**Method and route of administration**

Hulio is administered by injection under the skin (subcutaneous use).

Detailed instructions on how to inject Hulio are provided in Section 7 - Instructions for use.

**If you use more Hulio than you should**

If you accidentally inject Hulio more frequently than you should, call your doctor or pharmacist and explain that you have taken more than required. Always take the outer carton of the medicine with you, even if it is empty.

**If you forget to use Hulio**

If you forget to give yourself an injection, you should inject the next dose of Hulio as soon as you remember. Then take your next dose as you would have on your originally scheduled day, had you not forgotten a dose.

**If you stop using Hulio**

The decision to stop using Hulio should be discussed with your doctor. Your symptoms may return upon stopping treatment.

If you have any further questions on the use of this medicine, ask your doctor or pharmacist.

**4. Possible side effects**

Like all medicines, this medicine can cause side effects, although not everybody gets them.

Most side effects are mild to moderate. However, some may be serious and require urgent medical treatment.

Side effects may occur up to 4 months or more after the last Hulio injection.
Seek medical attention urgently if you develop any of the following signs of allergic reaction or heart failure:

- severe rash, hives;
- swollen face, hands or feet;
- trouble breathing or swallowing;
- pale complexion, dizziness, persistent fever, bruising or bleeding very easily.

Tell your doctor as soon as possible, if you notice any of the following:

- signs and symptoms of infection such as fever, feeling sick, wounds, dental problems, burning on urination, feeling weak or tired or coughing;
- symptoms of nerve problems such as tingling, numbness, double vision or arm or leg weakness;
- signs of skin cancer such as a bump or open sore that doesn't heal;
- signs and symptoms suggestive of blood disorders such as persistent fever, bruising, bleeding, paleness.

The following side effects have been observed with adalimumab:

**Very common** (may affect more than 1 in 10 people):

- injection site reactions (including pain, swelling, redness or itching);
- respiratory tract infections (including cold, runny nose, sinus infection, throat infection, pneumonia);
- abnormal blood results;
- headache;
- abdominal (belly) pain;
- nausea and vomiting;
- pain in bone and muscles.

**Common** (may affect up to 1 in 10 people):

- any infection (including tuberculosis, blood poisoning, influenza, cellulitis, shingles, ear infections, tooth infections, cold sores, reproductive tract infections, urinary tract infection, fungal infections, joint infections);
- benign tumours;
- skin cancer;
- mild allergic reactions (including seasonal allergy);
- dehydration;
- mood swings (including depression);
- anxiety;
- difficulty sleeping;
- sensation disorders such as tingling, prickling or numbness;
- migraine;
- neck or back pain;
- vision disturbances;
- eye/eyelid inflammation or swelling;
- vertigo (sensation of the room spinning);
- cough;
- sensation of heart beating rapidly;
- high blood pressure;
- skin flushing;
- blood clot;
- asthma;
- bleeding in the stomach;
- indigestion, bloating, heart burn;
- acidity/acid reflux;
- dry eyes, dry mouth;
- itching, inflammation of the skin (including eczema);
• increased sweating;
• hair loss;
• new or worsening psoriasis (red, flaky skin);
• muscle spasms;
• blood in urine;
• kidney problems;
• slow healing of wounds.

Uncommon (may affect up to 1 in 100 people):
• cancer of the lymph system (lymphoma);
• immune disorders that could affect the lungs, skin and lymph nodes (most commonly as a condition called sarcoidosis);
• inflammation of blood vessels;
• tremor;
• nerve damage;
• stroke;
• double vision;
• hearing loss, buzzing;
• irregular heart beat;
• lung diseases causing shortness of breath (including inflammation);
• blockage in an artery of the lung;
• excessive fluid around the lung;
• inflammation of the pancreas;
• difficulty in swallowing;
• gallbladder inflammation, gallbladder stones;
• fatty liver (build up of fat in liver cells);
• night sweats;
• scarring;
• abnormal muscle breakdown;
• systemic lupus erythematosus (including inflammation of skin, heart, lung, joints and other organ systems);
• excessive night urination;
• impotence.

Rare (may affect up to 1 in 1,000 people):
• leukaemia (cancer affecting the blood and bone marrow);
• multiple sclerosis;
• nerve disorders (such as inflammation of the optic nerve to the eye, and Guillain-Barré syndrome, a condition that may cause muscle weakness, abnormal sensations, tingling in the arms and upper body);
• heart attack;
• pulmonary fibrosis (scarring of the lung);
• hole/tear in the intestine;
• inflammation of the liver;
• inflammation of blood vessels in the skin;
• Stevens-Johnson syndrome;
• inflammatory skin rash;
• lupus-like syndrome.

Not known (frequency cannot be estimated from available data):
• hepatosplenic T-cell lymphoma (a rare blood cancer);
• Merkel cell carcinoma (a type of skin cancer);
• liver failure;
• worsening skin rash with muscle weakness.
Reporting of side effects

If you get any side effects, talk to your doctor or pharmacist. This includes any possible side effects not listed in this leaflet.

You can also report side effects directly via the national reporting system listed in Appendix V. By reporting side effects you can help provide more information on the safety of this medicine.

5. How to store Hulio

Keep this medicine out of the sight and reach of children.

Do not use this medicine after the expiry date which is stated on the label/blister/carton after EXP. The expiry date refers to the last day of that month.

Store in a refrigerator (2°C – 8°C). Do not freeze.

Keep the pre-filled pen in the outer carton in order to protect from light.

Alternative Storage:

When needed (for example when you are travelling), a single Hulio pre-filled pen may be stored at room temperature (up to 25°C) for a maximum period of 14 days – be sure to protect it from light. Once removed from the refrigerator for room temperature storage, the pen must be used within 14 days or discarded, even if it is returned to the refrigerator.

You should record the date when the pen is first removed from refrigerator, and the date after which it should be discarded.

Do not throw away any medicines via wastewater or household waste. Ask your pharmacist how to throw away medicines you no longer use. These measures will help protect the environment.

6. Contents of the pack and other information

What Hulio contains
- The active substance is adalimumab.
- The other ingredients are monosodium glutamate, sorbitol, methionine, polysorbate 80, hydrochloric acid and water for injections.

What Hulio looks like and contents of the pack

Hulio 40 mg solution for injection (injection) in pre-filled pen is supplied as a sterile solution of 40 mg adalimumab dissolved in 0.8 ml clear or slightly opalescent, colourless to pale brownish-yellow solution.

The Hulio pre-filled pen is made of plastic with a stopper and a needle with a needle cap. Each pack contains 1, 2 or 6 pre-filled pens with 2, 2 or 6 alcohol pads. Not all pack sizes may be marketed.

Hulio is also available as a vial for paediatric use or a pre-filled syringe.

Detailed information on this medicine is available on the European Medicines Agency web site:

7. Instructions for use

Read the instructions carefully and follow them step by step. Your doctor, nurse or other healthcare professional will first show you how to inject Hulio pre-filled pen. Ask your doctor or nurse if there is anything you do not understand.

Do not attempt to self-inject until you are sure that you understand how to prepare and administer the injection. After proper training, the injection can be self-administered or given by another person, for example a family member or carer.

Each pre-filled pen is for single-use only and contains one 40 mg dose of adalimumab.

Do not mix the Hulio solution with any other medicine.

To help you remember which day(s) of the week Hulio should be injected, it may be helpful to make a note on a calendar or in a diary.
Before you start

Find a quiet area with a well-lit, clean and flat work surface and gather all the supplies you will need to give yourself or receive the injection.

Supplies you will need:
- 1 pre-filled pen
- 1 alcohol swab
- 1 sharps disposal container (not included in Hulio pack)
- 1 gauze pad or cotton ball (not included in Hulio pack)

If you do not have all the supplies you need, ask your nurse or pharmacist.

Preparing the pre-filled pen

The pre-filled pens should be stored in the fridge (between 2°C to 8°C).
- Take a single pen out of the fridge at least 30 minutes before you intend to use it to allow the contents to reach room temperature.
  - DO NOT use other heat sources such as a microwave oven or hot water to warm the pen.
  - DO NOT put the pen back in the fridge after it has reached room temperature.
- Check the expiry date printed on the pen.
  - DO NOT use the pen if past the expiry date.
- Check the viewing window to make sure the medication is at or near the Fill Marker (you may need to shake gently to see this), and the liquid is clear, colourless and has no particles.
  - DO NOT use the pen if the medication is not near the Fill Marker.
  - DO NOT use the pen if the liquid is cloudy, discoloured, or has particles in it.

Injection steps

Follow the steps below carefully each time you inject Hulio pre-filled pen:

**Step 1 - Choose and prepare injection site**

Hulio pre-filled pen is for subcutaneous injection. It should be injected into the thigh or abdomen.

You should rotate and change your injection site each time, staying at least 3 cm from the previous site used.

If you are injecting into the abdomen, choose a site that is at least 5 cm away from the belly button.

- DO NOT inject into skin that is red, hard, bruised, or tender.
- DO NOT inject into scars or stretch marks.
- If you have psoriasis, **DO NOT** inject into any raised, thick, red, or scaly skin patches, or lesions.
- **DO NOT** inject through clothes. Roll back any clothing that may interfere with the injection site.

**Step 2 - Wash hands**  
Wash your hands with soap and water.

**Step 3 - Prepare injection site**  
Wipe the skin at the chosen injection site with an alcohol swab.
- Wait for it to dry on its own, do not blow dry it.
- **DO NOT** touch this area again before giving the injection.

**Step 4 - Uncap pen**  
Pull the needle cap straight off the pen. A few drops of liquid may come out of the needle, this is normal. It is also normal to see air bubble(s).
- **DO NOT** remove the needle cap until you are ready to inject.
- Pull the needle cap straight off the pen, **DO NOT** twist the cap.
- **DO NOT** re-cap or touch the needle with your fingers, or let the needle touch anything.
- **DO NOT** touch the Orange Activator with your fingers (this is where the needle comes out).
- **DO NOT** use the pen if it has been dropped onto a hard surface. Components inside the pen may be broken.
- **DO NOT** use the pen if the needle cap is missing or not securely attached.

**Step 5 - Squeeze & hold injection site**  
Gently squeeze the injection site to create a raised area, and hold that area firmly.

**Step 6 - Place pen**  
Place the Orange Activator end of the pen onto the injection site.

Keep the pen held at a 90° angle to the injection site, and with the Viewing Window visible to you.

Be careful to place the pen so that it will not inject into your fingers holding the injection site.

**Step 7 - Begin injection**  
**Step 8 - Hold down for 2nd “CLICK” & 10 seconds**
Step 7
Firmly push the body of the pen down against the injection site to engage the Orange Activator and begin the injection.

Continue holding down after hearing the 1st “CLICK”. This 1st “CLICK” signals the start of the injection.

In the Viewing Window, the Orange Indicator will advance to show the progress of the injection.

• DO NOT move, twist, or rotate the pen during injection.

Step 8
Continue holding the body of the pen down against the injection site until one, or all, of the following occur:

• A 2nd “CLICK” is heard,
• 10 seconds has passed,
• Orange Indicator has stopped and completely blocked the Viewing Window.

Step 9 - End of injection, remove pen
Pull the pen straight away from injection site.

After injection, if slight bleeding occurs from the injection site, press a gauze pad or cotton ball lightly against the skin for a few seconds - DO NOT rub the injection site. If needed, cover the injection site with a plaster.

Step 10 - Dispose pen & cap
Dispose of the used pen and cap in an approved sharps disposal container.

Check with your healthcare provider for instructions on how to properly dispose of a filled sharps container.

• DO NOT re-use the pen.
• DO NOT re-cap the needle.
• DO NOT throw the sharps container in your household bin.
• DO NOT recycle your used sharps disposal container.
• Always keep your sharps container out of the sight and reach of children.
